

Daily Run — 2026-07-12 (Sunday)

Sunday run. Twelfth consecutive daily run. Five positions open: BTC (day 10), ETH (day 9), UNI (day 9 — +1R BREAKEVEN HIT! Stop moved to BE), SOL (day 8), PLTR (day 5 — exit signal lifted July 11, conviction stable at 4). CRITICAL DEVELOPMENTS: (1) UNI SURGED TO \$3.66 — ABOVE +1R BREAKEVEN at ~\$3.60. Per \$7d exit ladder: stop moved from \$2.40 (initial) to \$3.20 (breakeven). Position is now a free option on the thesis. (2) Weekend — no equity market trading. Anchor remains July 10 close (Friday). (3) BTC stable at ~\$64,157 (slightly down from ~\$64,660 on July 11). (4) ETH slightly up to ~\$1,803 (from ~\$1,795). (5) SOL slightly down at ~\$76.77-78.18. (6) PLTR confirmed at \$126.79 (MarketBeat, July 10 close) — down 1.74%, below entry of \$134.24. Position underwater -5.5% (-0.79R). (7) NVDA confirmed at \$210.57 (Robinhood, July 11) — above 20-day MA, persistence day 2. (8) ONDO at \$0.329 (Coinbase direct USD!) + Ondo tokenizing SK Hynix shares via BNB Chain + OUSG fund at \$407M. (9) Crypto F&G at 25 (down 1 from 26). (10) CNN F&G at 49 (Neutral, up from 48). (11) ETF flows: +\$282M combined for week of July 7-11 — 8-week outflow streak ended (CryptoBriefing, The Block, CryptoDaily). (12) Clarity Act: Senate may release merged bill week of July 20 (CoinPaprika); ethics fight stalling vote (CryptoNews/The Hill); CFTC Chair says "must-pass" (BitRss). (13) Uniswap ~\$1B volume on Robinhood Chain in one week (Yahoo Finance); Robinhood Chain TVL at \$122M (Benzinga). (14) Oil stable: WTI \$71.41, Brent \$76.01. (15) Gold ~\$4,165 (July 11, up ~1%).

§8 Step 0 — Account Parameters

Read from prior run log header (2026-07-11): - **Capital: \$20,000 - MaxLeverage: 20x** - GS Tier 1 heat cap: 20% of Capital = **\$4,000**

§8 Step 1 — Regime Read

Anchor: July 10, 2026 close (Friday close — the prior daily settlement). Today is Sunday July 12; no equity market session has occurred since July 10 close. Per §8 step 1 anchor discipline, R is computed from the July 10 close — same anchor as the July 11 run. Same-day reruns reuse the same anchor. **R is unchanged from July 11: R = -0.2.** Crypto trades 24/7 but the regime anchor is fixed per day and only changes on a genuine regime break (FOMC, major data surprise, real shock). The weekend crypto price action (BTC ~\$64,157, slightly down; ETH ~\$1,803, slightly up; UNI surging) is noted as watch items but does not re-set R.

Input	Value (July 10 close)	Signal
10Y UST yield	4.56%	Rates firm; demand for duration stable
2Y UST yield	4.21%	Short-end still pricing hawkish Fed
2s10s spread	~+0.35% (positive, stable)	No recession signal; curve positive
DXY	~100.94	USD firm — mild risk-off
VIX	15.03 (-5.11% on July 10)	Volatility dropping — risk recovering
S&P 500	7,575.39 (+0.42%)	Recovering — second consecutive up day
Dow	52,637.01 (+0.29%)	Up — broad recovery
Nasdaq	26,281.61 (+0.29%)	Up — tech stable (NVDA +3.91% led)
Russell 2000	2,977.81 (-0.49%)	Small caps lagged — divergence
Breadth	~66% S&P >200-day MA	Two-thirds above key MAs — stable
CNN Fear & Greed	49 (Neutral, July 11)	Neutral — stable, up 1 from 48
Fed funds	3.50-3.75%	FOMC hawkish but market recovering

Input	Value (July 10 close)	Signal
June payrolls	+57K (prior trigger, unchanged)	Dovish on growth — still the dominant signal
Gold	~\$4,165 (July 11, up ~1%)	Safe-haven bid stable — not surging
Oil (WTI)	\$71.41 (−0.93%, July 10)	EASING — Iran premium fading
Brent	~\$76.01 (July 11)	Easing — stable
HY OAS	~267bp (approx, stable)	No credit stress — stable
BTC ETF flows	+\$282M combined week July 7-11	BULLISH — 8-week outflow streak ENDED
ETH ETF flows	Included in +\$282M weekly total	BULLISH — inflows resumed
Jobless claims	215K (stable)	Labor market stable at weekly level
NVDA	\$210.57 (July 11, +3.91% on July 10)	Semis rallying — AI sector risk-on

R = −0.2 (unchanged from July 11 — same anchor, no regime break)

Rationale: The July 10 close anchor is unchanged from the prior run. Weekend crypto price action is noted but does not re-set R. The regime is recovering toward neutral: VIX dropped sharply to 15.03, oil easing (WTI \$71.41), ETF flows turned positive (+\$282M for the week ending July 11, ending 8-week outflow streak), NVDA led the S&P +3.91% on July 10. The remaining negatives: June payrolls (+57K) still bad, Fed still hawkish (September hike pricing), DXY firm. **CPI on July 14 (Tuesday) is the next major data point** — if in-line or cooler, R could improve to neutral (0). Fed Chair Warsh testifying to Congress same day. This is a critical week: CPI + Fed testimony + ASML/TSM earnings + big banks + Crypto Clarity Act field hearing.

Zone: CORE ($|R| = 0.2 < 1.3$) — regime enters as a mild directional nudge.

Regime smile contribution (RS): For core zone, $RS = 0.6 \cdot R \cdot \beta$. - High-beta ($\beta=1.3$): $RS = 0.6 \cdot (-0.2) \cdot 1.3 = -0.156$ - Normal ($\beta=1.0$): $RS = 0.6 \cdot (-0.2) \cdot 1.0 = -0.12$ - Defensive ($\beta=0.7$): $RS = 0.6 \cdot (-0.2) \cdot 0.7 = -0.084$

Growth-Score Dial

Trigger	Status	Detail
(a) Payrolls	FIRE Δ	June +57K (massive miss). 3-month average ~119K. Trajectory sharply negative. FIRE — unchanged.
(b) Curve	NOT FIRE	2s10s at ~+0.35% — positive, not re-inverted. Stable. No trigger.
(c) Credit	NOT FIRE	HY OAS at ~267bp — no spike >75bp above 3-month low. Credit orderly. No trigger.

GS TIER = 1 (one trigger: payrolls). **Heat cap = 20% of Capital (\$4,000).** Unchanged. CPI on July 14 is the next test — if payrolls weakness is confirmed by weak CPI, the growth scare deepens. But oil is easing and credit is stable, so the risk of Tier 2 upgrade is decreasing.

Watch items (not folded into R unless they persist): - **CPI JULY 14 (TUESDAY) — CRITICAL.** Next major data point. Fed Chair Warsh testifying to Congress same day. Schwab: "Fasten those seatbelts for one of the quarter's busiest weeks." If CPI is in-line or cooler (oil easing → CPI should be benign), R could improve to neutral (0). If hot, the recovery stalls. This is the most important data point of the week. - **ASML and TSM earnings next week** — Schwab highlights. If they beat, the semi cluster bottoming thesis is confirmed. NVDA already rallied +3.91% on July 10 — confirmation would push the cluster higher. - **Crypto Clarity Act: Senate may release merged bill week of July 20** (CoinPaprika: "Senators may release a merged Digital Asset Market Clarity Act as soon as the week of July 20, 2026. The rewritten text combines the Senate Banking and Agriculture committee bills and reportedly adds over 70 pages."). Ethics fight stalling vote (CryptoNews: "Without several Democratic votes, the bill cannot clear the Senate"). CFTC Chair Mike Selig says "must-pass" (BitRss). The Hill: "Crypto bill faces make-or-break moment ahead of August recess." SEC

may start rulemaking before Senate votes (Cryptonomist: three SEC proposals penciled in for July). This is the key secular catalyst for crypto. - **UNI +1R BREAKEVEN HIT.** UNI at \$3.66 — above the +1R target of ~\$3.60. Stop moved from \$2.40 (initial) to \$3.20 (breakeven) per \$7d exit ladder. The position is now a free option on the thesis. Uniswap ~\$1B volume on Robinhood Chain in one week (Yahoo Finance). Robinhood Chain TVL at \$122M (Benzinga). The structural expansion thesis is playing out. - **BTC weekend price action.** BTC at ~\$64,157 (OKX, July 12) — slightly down from ~\$64,660 on July 11. Stable above \$63K support. Approaching 50-day MA at ~\$65K — a close above \$65K would be a trend gate upgrade (full size). BTC approaching +1R breakeven at ~\$67,000 (+9.1% from \$61,500 entry). - **ONDO fresh USD data.** ONDO at \$0.329 (Coinbase direct USD, July 12) — down 1% in 24h. Fresh catalyst: Ondo Finance tokenizing SK Hynix shares via BNB Chain (HokaNews, July 12). CryptoSlate: "Ondo's OUSG already holding hundreds of millions onchain" — \$407M Treasury fund. The RWA thesis is accelerating. - **ETH ETF flows.** Week of July 7-11: +\$282M combined BTC+ETH ETF inflows (CryptoBriefing, The Block). The 8-week outflow streak that drained \$9.46 billion has ended. "The bleeding has stopped for now" (CryptoBriefing). This is a significant institutional flow reversal. - **Iran/Hormuz ONGOING but CONTINUING TO EASE.** Oil stable: WTI \$71.41, Brent \$76.01. Market is looking past it. - **MSTR \$1.25B BTC sale overhang.** Yahoo Finance July 11: "Strategy Says It Might Sell Up to \$1.25 Billion in Bitcoin." This remains an overhang on MSTR and potentially on BTC if the sale executes. - **PLTR at \$126.79** (MarketBeat confirmed). Down 1.74% on July 10. Below entry of \$134.24 (−5.5%, −0.79R). Trefis support zone \$122.59-\$135.49 — stock is in the zone. Q2 earnings approaching. Prediction markets peg 76.5% odds PLTR touches \$138 in July (AOL). Cestrian Capital: "Accumulate; PT \$177; STP \$105" — two tailwinds at work.

§8 Step 2 — Freshness Check (Crypto)

Input	Source	Freshness	Q impact
Crypto F&G	Gate/Coinglass: 25 (July 12); FearGreedMeter: 26 (July 11)	25-26 (July 12)	☐ Current — stable, slight dip
BTC price	OKX: \$64,156.9 (+0.86% 24h, July 12); NewHedge: liquidations at \$63,722	~\$64,157 (July 12)	☐ Current — stable
ETH price	Yahoo Finance: \$1,803.84; MidForex: \$1,802.92; TheBlock: \$1,804.33	~\$1,803-1,804 (July 12)	☐ Current — slightly up
SOL price	Coinbase: \$76.77; OKX: \$78.18 (−0.17% 24h); MidForex: \$76.28	~\$76.28-78.18 (July 12)	☐ Current — slightly down
UNI price	TheCurrencyAnalytics: \$3.66 (+4.71%); CNYES: \$3.83 (24h high, +8.45%); Coinbase EUR: €3.26	~\$3.66 (July 12)	☐ Current — SURGING
ONDO price	Coinbase: \$0.329 (−1% 24h, July 12)	\$0.329 (July 12)	☐ Current — FRESH DIRECT USD
BTC/ETH ETF flows	CryptoBriefing: +\$282M combined week July 7-11; BlockchainReporter: BTC +\$90.44M, ETH +\$18.43M July 10	☐ Current — week summary	☐ Current — 8-week streak ended
Iran/Hormuz	Oil stable: WTI \$71.41, Brent \$76.01	☐ Current — EASING	☐ Current
Oil prices	TradingEconomics: WTI \$71.41 (July 10); Pintu: WTI \$74.69, Brent \$76.01 (July 11)	☐ Current — stable/easing	☐ Current

TSM	—	Semi cluster — earnings next week (Schwab highlight)

Tier-1 Flags → Tier-2 Deep Dive Candidates

1. **UNI** — +1R BREAKEVEN HIT! Stop moved to BE. Robinhood Chain ~\$1B volume. TVL \$122M. Best performer.
2. **BTC** — ETF flows +\$282M weekly; approaching 50-day MA (~\$65K) + +1R at ~\$67K; Clarity Act bill week of July 20
3. **ETH** — ETF flows positive weekly; price ~\$1,803, approaching 50-day EMA (~\$1,803); +1R at ~\$1,890
4. **SOL** — slightly down but holding above 20/50-day EMAs; CryptoBasic buy signal \$100-\$127
5. **ONDO** — fresh direct USD \$0.329; Ondo tokenizing SK Hynix shares; OUSG \$407M; RWA thesis accelerating
6. **PLTR** — \$126.79 confirmed; Trefis support zone; Q2 earnings approaching; conviction 4 (exit signal lifted)
7. **NVDA** — \$210.57 confirmed; persistence day 2; ASML/TSM earnings next week; semi cluster bottoming
8. **MSTR** — \$1.25B BTC sale overhang; below all MAs; avoid
9. **RKLB** — conflicting data; below 200-day MA; CEO selling; avoid

§8 Step 4 — Tier-2 Deep Dives

BTC (Bitcoin) — β -tier: Normal (1.0) — POSITION OPEN (Day 10)

Catalyst (w=0.28): - BTC at ~\$64,157 (OKX, July 12, +0.86% 24h); 24h range tight, NewHedge shows liquidations at \$63,722 (long) and shorts liquidated - **BTC ETF FLOWS: +\$282M combined for week of July 7-11** (CryptoBriefing, The Block, CryptoDaily) — ending the 8-week outflow streak that drained \$9.46 billion. BlockchainReporter: BTC +\$90.44M on July 10 alone (Farside). "The bleeding has stopped for now" (CryptoBriefing). - **Crypto Clarity Act: Senate may release merged bill week of July 20** (CoinPaprika: "The rewritten text combines the Senate Banking and Agriculture committee bills and reportedly adds over 70 pages."). The Hill: "Crypto bill faces make-or-break moment ahead of August recess." CFTC Chair Mike Selig: "must-pass." CryptoNews: "Without several Democratic votes, the bill cannot clear the Senate." SEC may start rulemaking before Senate votes (Cryptonomist: three SEC proposals penciled in for July). - **MSTR \$1.25B BTC sale overhang** (Yahoo Finance, July 11): "Strategy Says It Might Sell Up to \$1.25 Billion in Bitcoin" — potential new overhang on BTC if the sale executes. This is a negative for BTC supply/demand in the short term. - Crypto F&G at 25 (July 12, Gate/Coinglass) — stable, slight dip from 26 - CoinCodex: RSI at 52.50 (neutral) - **Score: +1.5** (unchanged from July 11) — The weekly ETF flow reversal (+\$282M) is the most positive BTC catalyst development in weeks. The 8-week outflow streak has ended. The Clarity Act is progressing (merged bill week of July 20). However, the MSTR \$1.25B BTC sale overhang is a new negative that partially offsets. Net catalyst score maintained at +1.5 — the institutional flow reversal and regulatory progress outweigh the MSTR overhang for now.

Sentiment/Positioning (w=0.30): - Crypto F&G: 25 (July 12, Gate/Coinglass). FearGreedMeter: 26 (July 11). - At P = 25, in the 25-40 range: SC_base = 0 $\rightarrow$ +0.75 (linear). At P=25: SC = +0.75 $\times$ (40-25)/(40-25) = +0.75. - **Divergence booster check:** BTC price slightly down (~\$64,157 from ~\$64,660) while ETF flows turned positive (+\$282M weekly) and F&G stable at 25 — mild divergence (price not following positive flows). Push SC +0.10 $\rightarrow$ SC = +0.85. - **SC = +0.85** (UP from +0.70 on July 11) — F&G dipped to 25 (from 26), staying in the 25-40 "Getting fearful" band. The divergence booster (price down while flows positive) adds +0.10. At P=25: SC = +0.75 + 0.10 = +0.85.

Trend/Technical (w=0.25): - BTC at ~\$64,157 — above the 20-day MA (~\$61,500-62,000). Confirmed above. - Approaching the 50-day MA (~\$65,000-66,000) — a close above \$65K would upgrade the trend gate to full size - Below 200-day MA — long-term trend still lower - CoinCodex RSI at 52.50 (neutral) - **Score: +0.5** (unchanged) — BTC is above the 20-day MA, approaching the 50-day. Per §5 trend gate: **above the 20-day but below the 50-day $\rightarrow$ starter only at $\frac{1}{2}$ formula size** for new entries/adds. Position is grandfathered. A close above \$65K would be a significant trend gate upgrade.

Regime (w=0.12): - RS = -0.12 (core zone, unchanged) - **Score: -0.12**

Secular (w=0.05): - BTC secular: Crypto Clarity Act is a genuine secular catalyst — regulatory clarity would structurally benefit BTC and the entire crypto ecosystem for years. ETF flows turning positive (+\$282M weekly) confirms institutional adoption continues despite the 8-week pause. MSTR \$1.25B sale is a tactical overhang, not a secular negative. - **Score: +0.5** (unchanged — the Clarity Act remains the key secular catalyst; ETF flow reversal confirms institutional demand is intact)

Direction:

$$\begin{aligned} D &= 0.28(+1.5) + 0.30(+0.85) + 0.25(+0.5) + 0.12(-0.12) + 0.05(+0.5) \\ &= 0.42 + 0.255 + 0.125 - 0.014 + 0.025 \\ &= +0.811 \end{aligned}$$

D = +0.81 (UP from +0.77 on July 11) — Improvement driven by the divergence booster (price down while ETF flows positive) pushing SC from +0.70 to +0.85. The weekly ETF flow data (+\$282M) confirms the July 10 daily reversal was not a one-day anomaly. D is the highest it's been during the position's life. Well above the 0.4 threshold.

Conviction: - Strength = $0.81/2 = 0.405$ - Agreement: contributions = [+0.42, +0.255, +0.125, -0.014, +0.025]; $\Sigma[\text{contrib}] = 0.839$; $|\Sigma| = 0.811$; A = $0.811/0.839 = 0.967$ - Q = 0.85 (ETF flow reversal confirmed)

weekly; price data solid; F&G stable; Clarity Act progressing — all high quality) - Conviction = $\text{round}(1 + 9 \cdot (0.405^{0.5} \cdot 0.967^{0.3} \cdot 0.85^{0.2})) = \text{round}(1 + 9 \cdot (0.636 \cdot 0.989 \cdot 0.968)) = \text{round}(1 + 9 \cdot 0.609) = \text{round}(6.48) = 6$ (unchanged from July 11, but closer to 7)

Action: BUY ($D \geq 0.4$, Conviction ≥ 6). PERSISTENCE MET — twelfth consecutive run. **POSITION OPEN** (July 3, \$61,500 entry, \$7,830 notional, \$56,000 stop). Signal improved: D +0.81 (from +0.77), Conviction 6 (unchanged but near 7). **R-progress: +0.43R** (price ~\$64,157 vs \$61,500 entry = +4.3%). BTC is approaching both the 50-day MA (~\$65K) and +1R breakeven (~\$67,000). **Trend gate: above the 20-day MA → starter size eligible. Below 50-day → ½ formula size only.** A close above \$65K upgrades to full size.

Key risk: MSTR \$1.25B BTC sale could create short-term supply overhang. CPI on July 14 is critical — hot CPI could stall the recovery. But the weekly ETF flow reversal (+\$282M) is the most bullish development since the position was opened. **BTC is approaching +1R breakeven at ~\$67,000 (+9.1% from entry). If hit, move stop to \$61,500 (BE) per \$7d exit ladder.**

ETH (Ethereum) — β -tier: Normal (1.0) — POSITION OPEN (Day 9)

Catalyst ($w=0.28$): - ETH at ~\$1,803-1,804 (Yahoo Finance \$1,803.84; MidForex \$1,802.92; TheBlock \$1,804.33) — slightly up from ~\$1,795 on July 11 - **ETH ETF FLOWS: included in +\$282M combined weekly total** (CryptoBriefing, The Block). BlockchainReporter: ETH +\$18.43M on July 10 alone (BlackRock ETHA \$16.2M led). The 8-week outflow streak has ended. - Standard Chartered cut 2026 ETH target to \$4,000 (from higher, per Investing.com) — still overhanging but market has absorbed it - BlackRock staked ETH ETF (ETHB) distributing monthly yield — still in place - JPMorgan tokenized MMF on Ethereum — still in place - Glamsterdam upgrade (ePBS + parallel tx processing) set for H2 2026 - Vitalik Buterin "Lean Ethereum" plan — still relevant - Record-low exchange supply → supply squeeze dynamics - **Score: +1.0** (unchanged from July 11) — The ETH ETF flow reversal (+\$18.4M July 10, +\$282M weekly combined) confirmed. Price recovered to ~\$1,803, approaching the 50-day EMA (~\$1,803). The structural catalysts (BlackRock, JPMorgan, Glamsterdam) remain intact. Score maintained at +1.0.

Sentiment/Positioning ($w=0.30$): - Crypto F&G: 25 (July 12, Gate/Coinglass). Using $P=25$: $SC_{\text{base}} = +0.75$ (at $P=25$ in the 25-40 range, linear). - **Divergence booster:** ETH price UP (+0.4% to ~\$1,803) while crypto F&G dipped slightly (25 from 26) — mild divergence (price up while sentiment flat). Push $SC +0.05 \rightarrow SC = +0.80$. - **SC = +0.80** (UP from +0.70 on July 11) — F&G at 25 gives base $SC = +0.75$, plus mild divergence booster +0.05 = +0.80. The contrarian credit is higher because F&G dipped and price didn't follow it down.

Trend/Technical ($w=0.25$): - ETH at ~\$1,803-1,804 — above the 20-day EMA (~\$1,713.63). Confirmed above. - **AT the 50-day EMA (~\$1,802.93)** — a close above \$1,803 would be a trend gate upgrade to full size! - Above \$1,750 support (recovered from the brief break below) - **Score: +0.5** (unchanged) — ETH is at the 50-day EMA. Per \$5 trend gate: **above 20-day but below 50-day → starter only at ½ formula size** for new entries. Position is grandfathered. **A close above \$1,803 would upgrade to full size — this is the key level to watch.**

Regime ($w=0.12$): - $RS = -0.12$ (core zone, unchanged) - **Score: -0.12**

Secular ($w=0.05$): - ETH secular: smart contract leader; ETF approved; BlackRock + JPMorgan institutional validation; staking yield; Glamsterdam upgrade; but Standard Chartered cut 2026 target to \$4,000 - **Score: +0.5** (unchanged)

Direction:

$$\begin{aligned} D &= 0.28(+1.0) + 0.30(+0.80) + 0.25(+0.5) + 0.12(-0.12) + 0.05(+0.5) \\ &= 0.28 + 0.24 + 0.125 - 0.014 + 0.025 \\ &= +0.656 \end{aligned}$$

D = +0.66 (UP from +0.63 on July 11) — Improvement from higher SC (+0.80 vs +0.70) due to F&G dip to 25 and mild divergence booster. D remains well above the 0.4 threshold.

Conviction: - Strength = $0.66/2 = 0.330$ - Agreement: contributions = $[+0.28, +0.24, +0.125, -0.014, +0.025]$; $\Sigma[\text{contrib}] = 0.684$; $|\Sigma| = 0.656$; $A = 0.656/0.684 = 0.959$ - $Q = 0.80$ (ETH ETF flows positive — fresh, multi-sourced; price recovered to ~\$1,803; at the 50-day EMA — key level; but Standard Chartered target cut still overhanging) - Conviction = $\text{round}(1 + 9 \cdot (0.330^{0.5} \cdot 0.959^{0.3} \cdot 0.80^{0.2})) = \text{round}(1 + 9 \cdot (0.574 \cdot 0.987 \cdot 0.956)) = \text{round}(1 + 9 \cdot 0.541) = \text{round}(5.87) = 6$ (unchanged from July 11)

Action: BUY ($D \geq 0.4$, Conviction ≥ 6). PERSISTENCE MET. POSITION OPEN (July 4, \$1,720 entry, \$7,478 notional, \$1,490 stop). Signal stable/improving: $D +0.66$ (from $+0.63$), Conviction 6. ETH at ~\$1,803 is **at the 50-day EMA (~\$1,803)** — a close above would be a trend gate upgrade to full size. **R-progress: +0.48R** (price ~\$1,803 vs \$1,720 entry = $+4.8\%$). Stop at \$1,490 is 17% below current.

ETH at the 50-day EMA — KEY LEVEL. ETH at ~\$1,803 is testing the 50-day EMA at ~\$1,802.93. A daily close above \$1,803 would upgrade the trend gate from "starter only at $\frac{1}{2}$ formula size" to "full formula size." This is the most important level to watch for ETH. **ETH approaching +1R breakeven at ~\$1,890 (+9.7% from \$1,720 entry). If hit, move stop to \$1,720 (BE) per \$7d.**

Key risk: Standard Chartered's \$4,000 target cut is still overhanging. CPI on July 14 could impact ETH via the risk-assets channel. But the ETF flow reversal ($+\$282\text{M}$ weekly) is the key positive. If ETH closes above \$1,803 (50-day EMA), the trend gate upgrades to full size.

SOL (Solana) — β -tier: High-beta (1.3) — POSITION OPEN (Day 8)

Catalyst ($w=0.28$): - SOL at ~\$76.28-78.18 (Coinbase \$76.77; OKX \$78.18, -0.17% 24h; MidForex \$76.28) - Slightly down from \$77.98 on July 11 — mild pullback - Stable above 20/50-day EMAs (~\$74.65/75.96) - No major new catalyst today - **Score: +1.0** (unchanged) — Catalysts still present (stablecoin growth, network fundamentals). No major new development. Price slightly down but holding above key EMAs. Score maintained.

Sentiment/Positioning ($w=0.30$): - Crypto F&G: 25 (down from 26). Using $P=25$: $SC_{\text{base}} = +0.75$. -

Divergence check: SOL slightly down (-1.5%) while F&G dipped from 26 to 25 — aligned (both slightly bearish). No divergence booster. $SC = +0.75$. - **SC = +0.75** (UP from $+0.85$ on July 11 — but actually the divergence booster that was applied on July 11 no longer applies since SOL and F&G are moving in the same direction now. The base SC at $P=25$ is $+0.75$, up from $+0.70$ at $P=26$.)

Trend/Technical ($w=0.25$): - SOL at ~\$76.28-78.18 — above 20-day EMA (~\$74.65) and 50-day EMA (~\$75.96) - 21% below 200-day MA (\$99.31) - **Score: +0.5** (unchanged) — SOL is above both 20/50-day EMAs. Per \$5 trend gate: **full formula size eligible**. Position underwater but trend structure intact.

Regime ($w=0.12$): - $RS = -0.156$ (high-beta, core zone, unchanged) - **Score: -0.156**

Secular ($w=0.05$): - SOL secular: leading L1; stablecoin growth $+154\%$; network growth; institutional interest - **Score: +0.5**

Direction:

$$\begin{aligned} D &= 0.28(+1.0) + 0.30(+0.75) + 0.25(+0.5) + 0.12(-0.156) + 0.05(+0.5) \\ &= 0.28 + 0.225 + 0.125 - 0.019 + 0.025 \\ &= +0.636 \end{aligned}$$

D = +0.64 (DOWN from $+0.67$ on July 11) — The divergence booster from July 11 no longer applies (SOL and F&G now moving in the same direction). Base SC at $P=25$ is $+0.75$ (up from $+0.70$ at $P=26$, but the divergence booster is gone). Net effect: D slightly lower. D remains well above the 0.4 threshold.

Conviction: - Strength = $0.64/2 = 0.320$ - Agreement: contributions = $[+0.28, +0.225, +0.125, -0.019, +0.025]$; $\Sigma[\text{contrib}] = 0.674$; $|\Sigma| = 0.636$; $A = 0.636/0.674 = 0.944$ - $Q = 0.75$ (price data current; market conditions improving) - Conviction = $\text{round}(1 + 9 \cdot (0.320^{0.5} \cdot 0.944^{0.3} \cdot 0.75^{0.2})) = \text{round}(1 + 9 \cdot (0.566 \cdot 0.983 \cdot 0.944)) = \text{round}(1 + 9 \cdot 0.525) = \text{round}(5.73) = 6$ (unchanged from July 11)

Action: BUY ($D \geq 0.4$, Conviction ≥ 6). PERSISTENCE MET. POSITION OPEN (July 5, \$81.19 entry, \$4,740 notional, \$69.19 stop). Signal stable: $D +0.64$ (from $+0.67$), Conviction 6. SOL at ~\$76.28-78.18 is above

both 20/50-day EMAs — trend gate intact. Position underwater: -3.9% to -6.1% from entry ($-0.26R$ to $-0.39R$ — slightly worse than $-0.26R$ on July 11 as price pulled back). Stop at \$69.19 is 10-12% below current.

Key risk: SOL is pulling back slightly but holding above key EMAs. The regime is stable ($R = -0.2$). If BTC breaks above \$65K, SOL should follow higher. The position is close to breakeven (\$81.19 entry vs \$76.28-78.18 current = $-\$3.01$ to $-\$4.91$, or -3.7% to -6.1%). Watch if \$74.65 (20-day EMA) breaks — that would trigger trend gate block.

UNI (Uniswap) — β -tier: High-beta (1.3) — POSITION OPEN (Day 9) — $\square$ +1R BREAKEVEN HIT! STOP MOVED TO BE

Catalyst ($w=0.28$): - UNI at $\sim \$3.66$ (TheCurrencyAnalytics: "Uniswap rose 4.71% to \$3.66"; CNYES: 24h high \$3.83, +8.45%; Coinbase EUR: €3.26, +2% 24h) - $\square$ +1R **BREAKEVEN HIT!** UNI at \$3.66 is above the +1R target of $\sim \$3.60$ (+12.5% from \$3.20 entry). Per \$7d exit ladder: **stop moved from \$2.40 (initial) to \$3.20 (breakeven)**. The position is now a free option on the thesis. - **Uniswap $\sim \$1B$ volume on Robinhood Chain in one week** (Yahoo Finance: "The DEX has facilitated $\sim \$1B$ in total volume on Robinhood Chain in one week, and activity surges like this generate protocol fees that can be converted into UNI burns, thus Robinhood Chain's continued success bodes well for UNI long-term") - **Robinhood Chain TVL at \$122M** (Benzinga: "Robinhood Chain's total value locked (TVL) has gone parabolic, reaching \$122 million. Most of this growth has been driven by Morpho Blue, a top lending protocol, and Uniswap.") - crypto.news: "Robinhood Chain's total value locked climbed above \$115 million after increasing 23% in 24 hours, while cumulative addresses approached 200,000." - The Coin Republic (July 11): "Uniswap has been playing a major role in the recent Robinhood chain launch" - TronWeekly: "Uniswap Eyes Breakout: Can UNI Price Rally To The \$5.19 Target Next?" — support \$3.20, resistance at \$3.58-5.19 - The Coin Republic: "it still has some room for more upside before encountering its next resistance zone above \$4" - Uniswap V4 pursuing LP reward overhaul (up to 33% cut) to improve trading efficiency - BWS auction closed July 10 — results pending - FOLD auction launched July 8 — ongoing - Uniswap processed 58% of stable-to-stable swap volume of EVM chains - Robinhood Chain L2 mainnet live — Uniswap is the primary public AMM - Analyst Kendrick projects \$6.50 for UNI by end of 2026 - **Score: +2.0** (unchanged) — The catalyst package remains the strongest in the universe and the thesis is playing out in real-time: \$1B Robinhood Chain volume, TVL \$122M, UNI at \$3.66 above +1R breakeven. The structural expansion (Uniswap as token launch platform + Robinhood Chain + fee switch + V4 LP overhaul + \$1B+ volume) is being confirmed by data. Score maintained at +2.0.

Sentiment/Positioning ($w=0.30$): - Crypto F&G: 25 (July 12). Using $P=25$: $SC_{base} = +0.75$. - **Divergence booster:** UNI at \$3.66 (+4.71%) while broad crypto F&G at 25 (Fear) — UNI is significantly outperforming the market on its own catalysts. UNI-specific strength vs market fear is a strong divergence. Push $SC +0.30 \rightarrow SC = +1.05$. Cap at +1.0 (within $[-2, +2]$) but the max in this band would be +1.0 for the divergence booster at $P=25$). - Actually, the base SC at $P=25$ is +0.75. The divergence booster pushes $+0.30 \rightarrow SC = +1.05$, but let me be more precise. The \$6 divergence booster says "push SC a further ± 0.5 toward the fade (within $[-2, +2]$)." Since we're in the bullish direction, push +0.5 max. At $P=25$ with UNI outperforming massively: $SC = +0.75 + 0.30 = +1.05$. Rounded: $SC = +1.0$. - **SC = +1.0** (UP from +1.0 on July 11 — the divergence booster remains in place as UNI continues to massively outperform the broad crypto market which is still in Extreme Fear)

Trend/Technical ($w=0.25$): - UNI at $\sim \$3.66$ — above 10/20/50/100-day EMAs (confirmed) - "Maintaining bullish near-term bias as price rises above the 50-day EMA at \$3.08 and the 50% retracement of the \$4.20 to \$2.31 downswing at \$3.10" (FXStreet) - Breaking above the \$3.58 resistance (TronWeekly) — next target \$5.19 - **Score: +1.5** (UP from +1.0) — UNI at \$3.66 is breaking above the \$3.58 resistance zone. The trend is strengthening. All EMAs confirmed above. The next target is \$5.19 (TronWeekly). This is the strongest trend in the universe. Score raised from +1.0 to +1.5 — the breakout above \$3.58 is a significant technical upgrade.

Regime ($w=0.12$): - $RS = -0.156$ (high-beta, core zone, unchanged) - **Score: -0.156**

Secular ($w=0.05$): - DeFi secular: Uniswap is the dominant DEX; Robinhood Chain integration (\$1B volume in one week!); BWS + FOLD auctions = expansion into capital formation infrastructure; 58% stable-to-stable

volume share; V4 LP overhaul improving efficiency; \$1B+ trading volume (DefiLlama) - **Score: +1.0** (unchanged — the secular thesis is being confirmed in real-time)

Direction:

$$\begin{aligned} D &= 0.28(+2.0) + 0.30(+1.0) + 0.25(+1.5) + 0.12(-0.156) + 0.05(+1.0) \\ &= 0.56 + 0.30 + 0.375 - 0.019 + 0.050 \\ &= +1.266 \end{aligned}$$

D = +1.27 (UP from +1.14 on July 11) — Significant improvement driven by: (1) trend score up from +1.0 to +1.5 (breakout above \$3.58 resistance), (2) SC maintained at +1.0 (divergence booster still active). D is the strongest in the universe by far and the highest it has ever been.

Conviction: - Strength = $1.27/2 = 0.635$ - Agreement: contributions = [+0.56, +0.30, +0.375, -0.019, +0.050]; $\Sigma|\text{contrib}| = 1.304$; $|\Sigma| = 1.266$; $A = 1.266/1.304 = 0.971$ - $Q = 0.90$ (UPGRADED — \$1B Robinhood Chain volume confirmed by Yahoo Finance; TVL \$122M confirmed by Benzinga; price at \$3.66 confirmed by TheCurrencyAnalytics and CNYES; multi-sourced, all aligned, thesis playing out in real-time — highest quality data point in the universe by a wide margin) - Conviction = $\text{round}(1 + 9 \cdot (0.635^{0.5} \cdot 0.971^{0.3} \cdot 0.90^{0.2}))$ = $\text{round}(1 + 9 \cdot (0.797 \cdot 0.991 \cdot 0.979))$ = $\text{round}(1 + 9 \cdot 0.772)$ = $\text{round}(7.95)$ = **8** (unchanged from July 11 — but at the very top of the 8 band, approaching 9)

Action: BUY ($D \geq 0.4$, Conviction ≥ 6). **PERSISTENCE MET. POSITION OPEN** (July 4, \$3.20 entry, \$1,600 notional). Signal is the strongest in the portfolio: D +1.27 (from +1.14), Conviction 8 (unchanged, near 9). **R-progress: +1.15R** (price ~\$3.66 vs \$3.20 entry = +14.4% from entry). **+1R BREAKEVEN HIT — STOP MOVED FROM \$2.40 (INITIAL) TO \$3.20 (BREAKEVEN)**. The position is now a free option on the thesis.

\$7d EXIT LADDER UPDATE: - **Rung 1 (initial stop): PASSED** — initial stop was \$2.40 - **Rung 2 (+1R, breakeven): HIT!** UNI at \$3.66 > \$3.60 (+1R). Stop moved to \$3.20 (BE) as of this run. - **Rung 3 (+1.5R, partial):** Next target — at +1.5R (~\$3.80), take $\frac{1}{3}$ – $\frac{1}{2}$ off. UNI at \$3.66 is approaching this target (+1.15R). **Watch \$3.78-3.80 for partial.** - **Rung 4 (runner):** Trail at chandelier stop (highest close – $2.5\text{--}3 \times \text{ATR}$) or the 20-day MA. After the partial, the runner is a free option on the thesis with BE stop.

Key risk: BWS auction closed — "buy the rumor, sell the news" risk if results disappoint. But the structural expansion (Uniswap as token launch platform + Robinhood Chain \$1B volume + fee switch + V4 LP overhaul) extends well beyond a single auction. **The position is now a free option — the stop is at breakeven. There is no more risk in this position.** The only decision left is when to take the partial at +1.5R (~\$3.80) and how to trail the runner.

ONDO (Ondo Finance) — β -tier: High-beta (1.3) — PERSISTENCE DAY 6

Catalyst (w=0.28): - ONDO at \$0.329 (Coinbase direct USD, July 12, -1% 24h) — **FRESH DIRECT USD DATA - Ondo Finance tokenizing SK Hynix shares via BNB Chain** (HokaNews, July 12: "BNB Chain is making headlines after the launch of tokenized SK Hynix shares through Ondo Finance") - **Ondo's OUSG fund holding \$407 million onchain** (CryptoSlate, July 12: "Tokenized sovereign debt is moving beyond theory, with live funds like Ondo's OUSG already holding hundreds of millions onchain") - Ondo Perps launched July 7 — 24/7 perps with tokenized stock collateral, 20x leverage - The tokenized RWA market is entering a new phase of growth, and ONDO is at the forefront - Ondo tokenized assets valued at \$996M with \$126M in 24-hour volume (from prior data) - **Score: +1.5** (unchanged) — The Ondo/SK Hynix tokenization via BNB Chain is a fresh, significant catalyst. The OUSG fund at \$407M confirms the RWA thesis is accelerating. The catalyst package remains strong. Score maintained at +1.5.

Sentiment/Positioning (w=0.30): - Crypto F&G: 25 (July 12). Using $P=25$: $SC_{\text{base}} = +0.75$. - No specific divergence booster (ONDO price down 1%, F&G down 1 — aligned). - **SC = +0.75** (UP from +0.70 on July 11 — F&G dipped from 26 to 25, increasing the contrarian credit slightly)

Trend/Technical (w=0.25): - **FRESH USD PRICE: \$0.329** (Coinbase, July 12) — this is the first direct USD quote. Prior runs used SGD conversion (~\$0.32). - Key levels from prior data: break above \$0.359 triggers move toward \$0.36-0.38; losing \$0.311 retests \$0.30 - At \$0.329, ONDO is likely above the 20-day EMA (prior

estimates placed it in the \$0.30-0.32 range). The \$0.329 price confirms ONDO is holding above \$0.31 support. - **Score: +0.5** (UP from 0.0) — With the fresh direct USD price of \$0.329, we can now verify ONDO is above key support levels. The price is above \$0.31 and approaching \$0.33. If the 20-day EMA is ~\$0.30-0.31, ONDO is above it. Score raised from 0.0 to +0.5 — the first direct USD data confirms ONDO is above support and trending higher.

Regime (w=0.12): - RS = -0.156 (high-beta, core zone, unchanged) - **Score: -0.156**

Secular (w=0.05): - RWA tokenization megatrend; ONDO is a leader; Perps platform expands ecosystem; \$3.4B tokenized assets surge; SK Hynix tokenization via BNB Chain; OUSG fund at \$407M - **Score: +1.0** (unchanged — the RWA thesis is accelerating with fresh SK Hynix tokenization and \$407M OUSG fund)

Direction:

$$\begin{aligned} D &= 0.28(+1.5) + 0.30(+0.75) + 0.25(+0.5) + 0.12(-0.156) + 0.05(+1.0) \\ &= 0.42 + 0.225 + 0.125 - 0.019 + 0.050 \\ &= +0.801 \end{aligned}$$

D = +0.80 (UP from +0.66 on July 11) — Major improvement driven by: (1) trend score up from 0.0 to +0.5 (first direct USD price confirms above support), (2) SC up from +0.70 to +0.75 (F&G dip). D is now the second-highest in the universe after UNI. Well above the 0.4 threshold.

Conviction: - Strength = $0.80/2 = 0.400$ - Agreement: contributions = [+0.42, +0.225, +0.125, -0.019, +0.050]; $\Sigma[\text{contrib}] = 0.839$; $|\Sigma| = 0.801$; $A = 0.801/0.839 = 0.955$ - $Q = 0.80$ (UPGRADED from 0.70 — fresh direct USD price from Coinbase at \$0.329; SK Hynix tokenization via BNB Chain confirmed by HokaNews; OUSG \$407M confirmed by CryptoSlate; multiple fresh catalysts — the data quality concern from prior runs is resolved) - Conviction = $\text{round}(1 + 9 \cdot (0.400^{0.5} \cdot 0.955^{0.3} \cdot 0.80^{0.2})) = \text{round}(1 + 9 \cdot (0.632 \cdot 0.986 \cdot 0.956)) = \text{round}(1 + 9 \cdot 0.595) = \text{round}(6.36) = 6$ (unchanged from July 11, but significantly higher quality — Q upgrade from 0.70 to 0.80)

Action: BUY — signal eligible ($D \geq 0.4$, Conviction ≥ 6 , persistence day 6). **Major upgrades from prior runs:** 1. $\square$ **Fresh direct USD price data** — Coinbase \$0.329 (no more SGD conversion approximation) 2. $\square$ **Trend gate: likely above 20-day EMA** — \$0.329 is above \$0.31 support, which aligns with or is above the 20-day EMA 3. $\square$ **Q upgraded from 0.70 to 0.80** — SK Hynix tokenization via BNB Chain + OUSG \$407M = fresh, direct, multi-sourced catalysts 4. $\triangle$ **Crypto cluster cap: only \$200 headroom** (\$2,800 used of \$3,000 cap). At Conv 6, risk per trade = $\$20,000 \times 5\% \times 6/10 = \600 — but crypto cluster only allows \$200 more. 5. **Entry still requires: trimming an existing crypto position or operator override.**

Key risk: The ONDO thesis has materially improved — fresh USD data, trend gate likely clear, Q upgraded, SK Hynix tokenization catalyst. The only blocker is the crypto cluster cap (\$200 headroom). Entry requires either trimming an existing crypto position (e.g., SOL which is underwater) or operator override. The RWA thesis is accelerating and ONDO is a leader — this is a high-quality setup that deserves operator attention.

PLTR (Palantir Technologies) — β -tier: High-beta (1.3) — POSITION OPEN (Day 5)

Catalyst (w=0.32): - PLTR at \$126.79 (MarketBeat confirmed, July 10 close, -1.74%) — **EXACT USD PRICE CONFIRMED** - Trefis (July 10): "PLTR Is Back At A Level It Has Defended Before" — support zone \$122.59-\$135.49 - Barchart (July 10): "For fiscal 2026, analysts project EPS \$1.17, up 85.7% from \$0.63 in fiscal 2025. EPS expected to rise 41.9% YoY to \$1.66 in fiscal 2027." - Seeking Alpha (July 11): "Valuation is at the low end of the historical range, with PLTR trading at 81.4x P/E NTM but offering superior growth and profitability versus winners like DDOG and SNOW" - AOL (July 11): "Prediction markets peg 76.5% odds PLTR touches \$138 in July" — positive signal - Cestrian Capital: "Accumulate; PT \$177; STP \$105" — "two tailwinds at work" - DA Davidson upgraded to Buy on July 2, price target \$175 (Barchart) - Q2 earnings report approaching — Barchart highlights this as a catalyst - TradingKey: NVDA partnership, Burry covered short, Trump owns \$1M+ stake — catalysts intact - Rule of 40 score 145% — matching NVDA, MU, SK Hynix - MarketBeat: consensus rating Moderate Buy, price target \$190.85 - **Score: +1.0** (unchanged) — The fundamental thesis remains intact. PLTR is at a historically defended support zone. Multiple analysts bullish (Cestrian \$177, DA Davidson

\$175, MarketBeat \$190.85). Q2 earnings approaching. Prediction markets 76.5% odds PLTR touches \$138 in July. Score maintained.

Sentiment/Positioning (w=0.22): - CNN F&G: 49 (Neutral) → $P \approx 49$ - PLTR-specific: at the bottom of a historically defended support zone (\$122.59-\$135.49), which is a high-conviction technical level. Stock is down 22.4% YTD (StocksToday) and near 52-week low (\$106.37). - PLTR-specific P is likely ~28-32 (more fearful than broad market at 49). Using $P=30$: in the 25-40 range: $SC_{base} = 0 \rightarrow +0.75$ (linear). At $P=30$: $SC = +0.75 \times (40-30)/(40-25) = +0.50$. - **SC = +0.5** (unchanged from July 11)

Trend/Technical (w=0.26): - PLTR at \$126.79 (MarketBeat confirmed); 52-week low \$106.37 - Trefis: support zone \$122.59-\$135.49 — "a level it has defended before" - Below entry of \$134.24 (−5.5%) - Below short-term MAs; below 20-day MA (50-day range \$107.27-\$160.65, current \$126.79) - **Score: −0.5** (unchanged) — Below the 20-day MA. Per \$5 trend gate: **if below the 20-day MA, no new position.** Position is grandfathered. The stock is at a historically defended support zone — if it holds and bounces above \$135.49 (top of Trefis zone), it could reclaim the 20-day MA.

Regime (w=0.15): - RS = −0.156 (high-beta, core zone, unchanged) - **Score: −0.156**

Secular (w=0.05): - AI/defense secular: strong; government + commercial AI adoption accelerating; Burry covering short is a secular positive; Q2 earnings could be a catalyst - **Score: +0.5**

Direction:

$$\begin{aligned} D &= 0.32(+1.0) + 0.22(+0.5) + 0.26(-0.5) + 0.15(-0.156) + 0.05(+0.5) \\ &= 0.32 + 0.11 - 0.13 - 0.023 + 0.025 \\ &= +0.302 \end{aligned}$$

D = +0.30 (unchanged from July 11) — D is still well below the 0.4 threshold — firmly in the neutral band.

Conviction: - Strength = $0.30/2 = 0.150$ - Agreement: contributions = [+0.32, +0.11, −0.13, −0.023, +0.025]; $\Sigma|\text{contrib}| = 0.608$; $|\Sigma| = 0.302$; $A = 0.302/0.608 = 0.497$ - $Q = 0.80$ (UPGRADED from 0.75 — MarketBeat confirms exact July 10 close at \$126.79; Trefis support zone; Barchart EPS estimates; Q2 earnings approaching; prediction markets 76.5% odds PLTR touches \$138 in July; Cestrian Capital PT \$177; DA Davidson Buy \$175 — data quality is now solid with exact USD close) - Conviction = $\text{round}(1 + 9 \cdot (0.150^{0.5} \cdot 0.497^{0.3} \cdot 0.80^{0.2})) = \text{round}(1 + 9 \cdot (0.387 \cdot 0.812 \cdot 0.956)) = \text{round}(1 + 9 \cdot 0.300) = \text{round}(3.70) = 4$ (unchanged from July 11)

Action: HOLD (D = +0.30 is below 0.4 threshold → neutral band; Conviction = 4). **POSITION OPEN** (July 7, \$134.24 entry, \$6,579 notional, \$122.00 stop). Position underwater on day 5: \$126.79 vs \$134.24 entry = −\$7.45/share = −5.5% = **−0.79R** (worse than the −0.47R to −0.79R estimated range on July 11, now confirmed at the bottom of the range).

Exit signal status: The conviction < 4 exit trigger that fired on July 9 and July 10 has been LIFTED since July 11 (Conv = 4). The system no longer says exit. The position is still underwater (−0.79R) and below the 20-day MA (trend gate blocks adds). The thesis remains intact (NVDA partnership, Army NGC2, Rule of 40 145%, Burry covered, Trump stake, Q2 earnings approaching, multiple analysts bullish). The Trefis support zone (\$122.59-\$135.49) is a positive — PLTR is in the zone. Stop at \$122.00 aligns with the Trefis support zone bottom.

Key risk: PLTR at \$126.79, stop at \$122 is 3.8% below. The Trefis support zone (\$122.59-\$135.49) aligns with the stop. If this support breaks, PLTR could fall to \$106. Q2 earnings are approaching — could be a catalyst (EPS \$1.17 FY2026, +85.7% YoY). Prediction markets 76.5% odds PLTR touches \$138 in July. **Watch: Q2 earnings date, Trefis support zone hold/break, 20-day MA reclaim.**

NVDA (Nvidia) — β-tier: High-beta (1.3) — PERSISTENCE DAY 2 — APPROACHING ENTRY THRESHOLD

Catalyst (w=0.32): - NVDA at \$210.57 (Robinhood, July 11); Yahoo: range \$201.92-\$211.00; previous close \$202.78 - Google Finance: Open \$202.00, High \$211.00, Low \$201.92, P/E 32.31, market cap \$5.11T - TradingEconomics: "Gains were led by Nvidia (3.91%)" on July 10 - SK Hynix raised \$26.5 billion in record U.S.

IPO (Sophic Capital) — catalyzing the semi cluster - Google Finance: "Nvidia Stock Has Only Gained 5% So Far in 2026" — lagging but recovering - Schwab: "ASML and TSM results are highlights next week" — semi earnings catalysts incoming - DeepSeek chip news + Chinese firms switching to domestic chips — still overhanging but market shrugging it off - \$1T Blackwell and Rubin revenue view intact - **Score: +1.0** (unchanged from July 11) — The +3.91% rally on July 10 is confirmed. SK Hynix IPO surge catalyzing semis. ASML and TSM earnings next week are additional catalysts. The semi cluster is showing real signs of bottoming. Score maintained.

Sentiment/Positioning (w=0.22): - CNN F&G: 49 (Neutral) → $P \approx 49$ - At $P = 49$, in 40-65 range: $SC = +0.4 \cdot \text{sign}(\text{Trend})$. NVDA trend is improving (rallied +3.91%, confirmed above 20-day MA) → $SC = +0.4 \cdot (+1) = +0.4$. - **SC = +0.2** (unchanged from July 11 — broad market Neutral, NVDA rallying but still near recent lows; the semi bounce is positive but needs confirmation. Giving a mild positive $SC = +0.2$ as a blend of the broad Neutral and NVDA-specific improvement)

Trend/Technical (w=0.26): - NVDA at \$210.57 (Robinhood, July 11) — confirmed above the 20-day MA (estimated ~\$200-205) - Rebounded from ~\$193.60 low on July 8 - Semi cluster led the market on July 9 (Nasdaq +1.30%) and July 10 (NVDA +3.91%) - 52-week range: \$162.02-\$236.54 — current \$210.57 is in the upper half - **Score: +0.5** (unchanged) — NVDA is above the 20-day MA. Per \$5 trend gate: **above the 20-day MA but below the 50-day → starter only at ½ formula size**. The 50-day MA is likely ~\$215-220 — NVDA needs to close above that for full size.

Regime (w=0.15): - $RS = -0.156$ (high-beta, core zone, unchanged) - **Score: -0.156**

Secular (w=0.05): - AI secular: dominant; competitive threats (DeepSeek, Chinese chips) but market shrugging off; \$1T revenue view; semis bottoming - **Score: +0.5**

Direction:

$$\begin{aligned} D &= 0.32(+1.0) + 0.22(+0.2) + 0.26(+0.5) + 0.15(-0.156) + 0.05(+0.5) \\ &= 0.32 + 0.044 + 0.13 - 0.023 + 0.025 \\ &= +0.496 \end{aligned}$$

D = +0.50 (unchanged from July 11) — D is above the 0.4 threshold for the second consecutive run.

Persistence day 2 — persistence MET. NVDA is now entry-eligible if Conviction reaches 6.

Conviction: - Strength = $0.50/2 = 0.250$ - Agreement: contributions = [+0.32, +0.044, +0.13, -0.023, +0.025]; $\Sigma[\text{contrib}] = 0.542$; $|\Sigma| = 0.496$; $A = 0.496/0.542 = 0.915$ - $Q = 0.85$ (TradingEconomics confirms +3.91%; Robinhood \$210.57 fresh; SK Hynix IPO real catalyst; ASML/TSM earnings next week — all high quality) — maintained - Conviction = $\text{round}(1 + 9 \cdot (0.250^{0.5} \cdot 0.915^{0.3} \cdot 0.85^{0.2})) = \text{round}(1 + 9 \cdot (0.500 \cdot 0.974 \cdot 0.968)) = \text{round}(1 + 9 \cdot 0.471) = \text{round}(5.24) = 5$ (unchanged from July 11)

Action: HOLD — PERSISTENCE MET (Day 2), but Conviction = 5 (below 6). D = +0.50 is above the 0.4 threshold for the second consecutive run. **Persistence is MET.** However, Conviction = 5 is below the standard entry threshold (6). NVDA is on the hot list — the hot-list threshold is $\text{Conv} \geq 5$, which is MET. **But the trend gate is the remaining barrier: NVDA is above the 20-day MA but below the 50-day → starter only at ½ formula size.**

NVDA is now ENTRY-ELIGIBLE as a hot-list name ($D \geq 0.4$ □, $\text{Conv} \geq 5$ □, $\text{persistence} \geq 2$ □, trend gate: above 20-day MA □ but below 50-day → ½ size only). If the operator approves, NVDA can be entered at ½ formula size as a hot-list name.

Key risk: ASML and TSM earnings next week are the key catalysts — if they beat, the semi cluster bottoming thesis is confirmed and NVDA could reach Conviction 6 (full entry threshold). CPI on July 14 is a risk for the entire market. The +3.91% rally needs follow-through. If NVDA opens lower on Monday and falls back below the 20-day MA, the trend gate re-blocks. **NVDA is the first potential new equity entry since PLTR.**

MSTR (Strategy Inc.) — β-tier: High-beta (1.3), BTC-proxy cluster — HOLD

Catalyst (w=0.32): - MSTR at ~\$95-96 (estimated from Yahoo Finance +0.80% on July 11 AM, STRF preferred at \$96.09); no direct USD quote today - Yahoo Finance (July 11): "Strategy Says It Might Sell Up to

\$1.25 Billion in Bitcoin. So Is MSTR a Buy, Sell, or Hold Right Now?" — overhang persists - New Bitcoin-focused capital plan (from July 10) — partially addressing forced BTC selling concern - Citi kept Buy rating, \$260 target - Blockonomi: "consensus 12-month price target stands at \$287.58" - Holdings: 843,775 BTC; \$1.25B in dry powder - Below all MAs (EMA20 \$108.91, EMA50 \$128.54, EMA200 \$184.21) - **Score: -0.5** (unchanged) — The \$1.25B BTC sale overhang persists. The forced BTC selling concern is not fully resolved. Score maintained.

Sentiment/Positioning (w=0.22): - Crypto F&G: 25 → P ≈ 25 - At P = 25, in the 25-40 range: SC_base = +0.75 - MSTR-specific: stock stabilizing (+0.80% July 11 AM) — sentiment slightly improving on the capital plan - **SC = +0.5** (unchanged — stabilizing but the \$1.25B BTC sale overhang tempers the improvement)

Trend/Technical (w=0.26): - MSTR at ~\$95-96; below EMA20 \$108.91, EMA50 \$128.54, EMA200 \$184.21 - **Score: -1.0** (unchanged) — Still below all MAs. Per \$5 trend gate: **NO NEW POSITION.**

Regime (w=0.15): - RS = -0.156 (unchanged) - **Score: -0.156**

Secular (w=0.05): - BTC-proxy secular: the new capital plan may restore the "pure play" narrative if it eliminates forced selling; but the \$1.25B BTC sale option is a concern - **Score: 0.0** (unchanged — the secular thesis is still in limbo)

Direction:

$$\begin{aligned} D &= 0.32(-0.5) + 0.22(+0.5) + 0.26(-1.0) + 0.15(-0.156) + 0.05(0.0) \\ &= -0.16 + 0.11 - 0.26 - 0.023 + 0.0 \\ &= -0.333 \end{aligned}$$

D = -0.33 (unchanged from July 11) — Still in the neutral band (above -0.4).

Conviction: - Strength = $0.33/2 = 0.165$ - Agreement: contributions = [-0.16, +0.11, -0.26, -0.023, 0.0]; $\Sigma|\text{contrib}| = 0.553$; $|\Sigma| = 0.333$; $A = 0.333/0.553 = 0.602$ - Q = 0.75 (DOWN from 0.80 — no direct USD quote today; Yahoo article and STRF preferred data are approximate) - Conviction = $\text{round}(1 + 9 \cdot (0.165^{0.5} \cdot 0.602^{0.3} \cdot 0.75^{0.2})) = \text{round}(1 + 9 \cdot (0.406 \cdot 0.846 \cdot 0.944)) = \text{round}(1 + 9 \cdot 0.324) = \text{round}(3.92) = 4$ (unchanged)

Action: HOLD (D = -0.33 is in the neutral band). The \$1.25B BTC sale overhang persists. MSTR is still below all MAs — trend gate blocks. **No position is open.** Avoid.

RKLB (Rocket Lab) — β -tier: High-beta (1.3) — HOLD/AVOID

Catalyst (w=0.32): - RKLB at ~\$81.04 (prior run, July 10 close, Yahoo Finance) - **Data conflict:** Capitaxer mentions \$101.65; TradingKey mentions \$102.79 on 4H chart — these may be stale or pre-correction. Using the July 10 close of \$81.04 from Yahoo Finance (prior run) as the conservative figure. - Morgan Stanley bull-case target \$293 — still in place - CEO Peter Beck selling \$465M — still overhanging - \$8B Iridium acquisition — mixed reactions - **Score: 0.0** (unchanged) — CEO selling remains the dominant negative. No fresh catalyst. Stock declining.

Sentiment/Positioning (w=0.22): - CNN F&G: 49 (Neutral) → P ≈ 49 - RKLB-specific: CEO selling, stock down 23.7% over prior month — bearish - RKLB-specific P is lower (~25-30) given the 23.7% monthly decline. At P=28: in 25-40 range: SC = $+0.75 \times (40-28)/(40-25) = +0.60$. - **SC = +0.4** (unchanged — blend of broad Neutral and RKLB-specific fear)

Trend/Technical (w=0.26): - \$81.04; 50-day MA ~\$108.81, 200-day MA ~\$86.56 - Below the 200-day MA (\$86.56) — critical support broken - **Score: -1.0** (unchanged) — Below the 200-day MA. Major bearish signal.

Regime (w=0.15): - RS = -0.156 (unchanged) - **Score: -0.156**

Secular (w=0.05): - Space economy secular: strong; SpaceX IPO catalyzing sector - **Score: +0.5**

Direction:

$$\begin{aligned}
 D &= 0.32(0.0) + 0.22(+0.4) + 0.26(-1.0) + 0.15(-0.156) + 0.05(+0.5) \\
 &= 0.0 + 0.088 - 0.26 - 0.023 + 0.025 \\
 &= -0.170
 \end{aligned}$$

D = -0.17 (unchanged from July 11) — In the neutral band.

Conviction: - Strength = $0.17/2 = 0.085$ - Agreement: contributions = $[0.0, +0.088, -0.26, -0.023, +0.025]$; $\Sigma|\text{contrib}| = 0.396$; $|\Sigma| = 0.170$; $A = 0.170/0.396 = 0.429$ - $Q = 0.65$ (DOWN from 0.75 — conflicting price data reduces confidence) - Conviction = $\text{round}(1 + 9 \cdot (0.085^{0.5} \cdot 0.429^{0.3} \cdot 0.65^{0.2})) = \text{round}(1 + 9 \cdot (0.292 \cdot 0.771 \cdot 0.921)) = \text{round}(1 + 9 \cdot 0.207) = \text{round}(2.86) = \mathbf{3}$ (unchanged)

Action: HOLD / AVOID. D = -0.17 is in the neutral band. Conviction = 3. Below the 200-day MA — trend gate blocks. CEO selling + Iridium deal + 23.7% monthly decline + 200-day MA break — all bearish. Avoid until the stock stabilizes above the 200-day MA (\$86.56).

§8 Step 5 — Summary Ratings Table

Crypto

Asset	D	Conv	Action	β-tier	Key Factors	Rationale
UNI	+1.27	8	BUY ▢↑▢	High-beta	Cat +2.0, Sent +1.0, Trend +1.5	+1R BREAK-EVEN HIT! Stop moved to \$3.20 (BE); Robinhood Chain ~\$1B volume in one week; TVL \$122M; breakout above \$3.58; next target +1.5R at ~\$3.80 for partial; POSITION OPEN; +14.4% from entry; free option now
BTC	+0.81	6	BUY ▢↑	Normal	Cat +1.5, Sent +0.85, Trend +0.5	IMPROVED: D +0.81 (from +0.77) on divergence booster (price down while ETF flows positive); ETF flows +\$282M weekly (8-week streak ended!); approaching 50-day MA + +1R at ~\$67K; Clarity Act bill week of July 20; POSITION OPEN; +4.3% from entry
ONDO	+0.80	6	BUY ▢↑	High-beta	Cat +1.5, Sent +0.75, Trend +0.5	MAJOR UPGRADE: D +0.80 (from +0.66) on first direct USD price (\$0.329, Coinbase) + trend score upgrade; SK Hynix tokenization via BNB Chain; OUSG \$407M; Q upgraded to 0.80; persistence day 6; BUT crypto cluster cap \$200 headroom — requires operator approval

Run notes

SUNDAY run. **R unchanged at -0.2** (same July 10 anchor — no equity market session since Friday). Weekend crypto price action noted but does not re-set R. **UNI +1R BREAKEVEN HIT!** UNI at \$3.66 (TheCurrencyAnalytics, +4.71%) is above the +1R target of ~\$3.60. Per \$7d exit ladder: **stop moved from \$2.40 (initial) to \$3.20 (breakeven)**. The position is now a free option on the thesis — there is no more risk in this position. Uniswap ~\$1B volume on Robinhood Chain in one week (Yahoo Finance). Robinhood Chain TVL at \$122M (Benzinga). The structural expansion thesis is playing out in real-time. Next target: +1.5R at ~\$3.80 for partial (⅓–½ off). **ETF flows: +\$282M combined for week of July 7-11** (CryptoBriefing, The Block, CryptoDaily) — ending the 8-week outflow streak that drained \$9.46 billion. "The bleeding has stopped for now." This is a significant institutional flow reversal. **Crypto Clarity Act: Senate may release merged bill week of July 20** (CoinPaprika: combines Senate Banking + Agriculture bills, 70+ new pages). The Hill: "make-or-break moment ahead of August recess." CFTC Chair: "must-pass." SEC may start rulemaking before Senate votes. **ONDO major data upgrade:** First direct USD price from Coinbase at \$0.329 (no more SGD approximation). Ondo tokenizing SK Hynix shares via BNB Chain (HokaNews, July 12). OUSG fund at \$407M (CryptoSlate). Q upgraded from 0.70 to 0.80. D jumped from +0.66 to +0.80. Trend score upgraded from 0.0 to +0.5 (first direct USD confirms above support). ONDO is now the second-highest D in the universe after UNI. **NVDA persistence MET (Day 2):** D > 0.4 for two consecutive runs (+0.50). Conv 5 (hot-list threshold MET). Above 20-day MA confirmed at \$210.57. NVDA is now **entry-eligible** as a hot-list name at ½ formula size — the first potential new equity entry since PLTR. ASML and TSM earnings next week could push Conv to 6. **ETH at the 50-day EMA:** ETH at ~\$1,803 = 50-day EMA (~\$1,802.93). A close above \$1,803 would upgrade the trend gate to full size — the key level to watch. **PLTR at \$126.79 confirmed** (MarketBeat). In Trefis support zone \$122.59-\$135.49. Conviction 4 (exit signal lifted). -0.79R underwater. Q2 earnings approaching. Prediction markets 76.5% odds PLTR touches \$138 in July. **CPI JULY 14 (TUESDAY) — CRITICAL.** Fed Chair Warsh testifying to Congress same day. This is the most important data point of the week. If in-line or cooler, R could improve to neutral (0). **Heat at \$3,400 (85% of \$4,000 cap).** **Crypto cluster at \$2,800 (93.3% — \$200 headroom).** **PLTR cluster at \$600 (20%).** Key action items: UNI +1.5R partial watch (\$3.80), BTC +1R breakeven watch (\$67K) + 50-day MA (\$65K), ETH 50-day EMA watch (\$1,803) + +1R (\$1,890), NVDA entry-eligible, ONDO entry blocked by cluster cap, CPI July 14.

Total notional (MaxLev × Capital)	\$400,000	\$28,227	□ 7.1%

Position Alerts

- **□ UNI — +1R BREAKEVEN HIT! STOP MOVED TO BE.** UNI at \$3.66 is above the +1R target of ~\$3.60 (+14.4% from \$3.20 entry). Per \$7d exit ladder: stop moved from \$2.40 (initial) to \$3.20 (breakeven). **The position is now a free option on the thesis — there is no more risk.** Next target: +1.5R at ~\$3.80 for partial (take ⅓–½ off). Robinhood Chain ~\$1B volume in one week. TVL \$122M. Breakout above \$3.58 resistance. TronWeekly target \$5.19. **This is the best-performing position in the portfolio (+14.4%, +1.15R) and is now risk-free.**
- **BTC — ETF FLOWS +\$282M WEEKLY.** The 8-week outflow streak that drained \$9.46 billion has ended. D improved to +0.81 (from +0.77) on the divergence booster (price down while ETF flows positive). BTC at ~\$64,157, approaching the 50-day MA (~\$65K) — a close above \$65K would be a trend gate upgrade (full size). **BTC approaching +1R breakeven at ~\$67,000** (+9.1% from \$61,500 entry). If hit, move stop to \$61,500 (BE) per \$7d. Crypto Clarity Act Senate bill week of July 20 is a catalyst. MSTR \$1.25B BTC sale is a new overhang.
- **ETH — AT THE 50-DAY EMA.** ETH at ~\$1,803 is testing the 50-day EMA at ~\$1,802.93. **A daily close above \$1,803 would upgrade the trend gate from "starter only" to "full formula size."** This is the key level to watch for ETH. ETF flows +\$282M weekly (8-week streak ended). D +0.66 (from +0.63). **ETH approaching +1R breakeven at ~\$1,890** (+9.7% from \$1,720 entry). If hit, move stop to \$1,720 (BE) per \$7d.
- **SOL — holding above EMAs but pulling back.** SOL at ~\$76.28-78.18, above 20/50-day EMAs but underwater (−3.9% to −6.1% from \$81.19 entry). D +0.64 (from +0.67 — divergence booster expired). Stop at \$69.19 is 10-12% below. Watch if \$74.65 (20-day EMA) breaks.
- **PLTR — stable in support zone.** PLTR at \$126.79 (MarketBeat confirmed). In Trefis support zone \$122.59-\$135.49. Conviction 4 (exit signal lifted). −0.79R underwater. Q2 earnings approaching. Prediction markets 76.5% odds PLTR touches \$138 in July. Stop at \$122.00 aligns with Trefis support. Multiple analysts bullish (Cestrian \$177, DA Davidson \$175, MarketBeat \$190.85).
- **NVDA — ENTRY-ELIGIBLE.** D > 0.4 for 2 consecutive runs (persistence MET). Conv 5 (hot-list threshold MET). Above 20-day MA confirmed at \$210.57. NVDA is now entry-eligible as a hot-list name at ½ formula size. ASML and TSM earnings next week could push Conv to 6 (full entry threshold). CPI July 14 is a risk.

Entry-Eligible

ONDO remains entry-eligible (D = +0.80, Conviction = 6, persistence day 6). Major upgrades from prior runs: 1. **□ Fresh direct USD price data** — Coinbase \$0.329 (no more SGD approximation) 2. **□ Trend gate: likely above 20-day EMA** — \$0.329 is above \$0.31 support 3. **□ Q upgraded from 0.70 to 0.80** — SK Hynix tokenization via BNB Chain + OUSG \$407M = fresh, direct, multi-sourced catalysts 4. **□ D upgraded from +0.66 to +0.80** — second-highest in the universe after UNI 5. **△ Crypto cluster cap: only \$200 headroom** (\$2,800 used of \$3,000 cap). At Conv 6, risk per trade = \$20,000 × 5% × 6/10 = \$600 — but

crypto cluster only allows \$200 more. 6. **Entry requires: trimming an existing crypto position or operator override. No entry without operator approval.**

NVDA now entry-eligible ($D = +0.50$, $\text{Conv} = 5$, persistence day 2). NVDA is on the hot list — the hot-list threshold is $\text{Conv} \geq 5$, which is MET. Trend gate: above 20-day MA $\rightarrow \frac{1}{2}$ formula size only. If the operator approves, NVDA can be entered at $\frac{1}{2}$ formula size as a hot-list name. At $\text{Conv} 5$, risk per trade = $\$20,000 \times 5\% \times 5/10 = \500 . Notional = $\$500 / \text{stop_distance}\%$. Semi cluster cap: \$3,000, only \$600 used (PLTR) $\rightarrow$ \$2,400 headroom. **NVDA fits within the semi cluster cap.**

Crypto cluster headroom: \$200 (\$3,000 cap – \$2,800 used). No new crypto entries possible without trimming or operator override.

Key Action Items for Operator

1. **UNI +1.5R PARTIAL WATCH (IMMEDIATE)** — UNI at \$3.66 is approaching +1.5R at $\sim \$3.80$ (+18.75% from \$3.20 entry). Per \$7d exit ladder: at +1.5R, take $\frac{1}{3}$ – $\frac{1}{2}$ off. **The stop is already at breakeven (\$3.20) — the position is a free option.** Robinhood Chain $\sim \$1\text{B}$ volume, TVL \$122M, breakout above \$3.58. Watch \$3.78–3.80 for the partial.
2. **BTC +1R BREAKEVEN WATCH** — BTC at $\sim \$64,157$, approaching +1R at $\sim \$67,000$ (+9.1%). If BTC hits \$67,000, move stop to \$61,500 (BE). Also watch for 50-day MA reclaim at $\sim \$65\text{K}$ — trend gate upgrade to full size. Clarity Act Senate bill week of July 20. MSTR \$1.25B BTC sale is a new overhang.
3. **ETH 50-DAY EMA + +1R WATCH** — ETH at $\sim \$1,803 = 50\text{-day EMA}$ ($\sim \$1,802.93$). A close above \$1,803 upgrades trend gate to full size. ETH approaching +1R at $\sim \$1,890$ (+9.7%). If hit, move stop to \$1,720 (BE).
4. **NVDA ENTRY DECISION** — NVDA is now entry-eligible as a hot-list name ($D \geq 0.4$, $\text{Conv} \geq 5$, persistence ≥ 2 , above 20-day MA). At $\frac{1}{2}$ formula size: risk = \$500, notional depends on stop distance. Semi cluster has \$2,400 headroom. **Operator decision required: enter NVDA at $\frac{1}{2}$ size, or wait for Conv 6 (ASML/TSM earnings next week could be the catalyst)?**
5. **ONDO ENTRY DECISION** — ONDO is entry-eligible ($D = +0.80$, $\text{Conv} = 6$, persistence day 6) with major data upgrades (first direct USD, SK Hynix tokenization, OUSG \$407M). But crypto cluster cap has only \$200 headroom. **Operator decision required: trim an existing crypto position (e.g., SOL which is underwater) to make room for ONDO, or override the cluster cap, or pass?**
6. **PLTR STATUS** — Stable at \$126.79 in Trefis support zone. Conviction 4 (exit signal lifted). -0.79R underwater. Q2 earnings approaching. Stop at \$122.00. No action needed unless support breaks.
7. **CPI JULY 14 (TUESDAY) — CRITICAL.** Next major data point. Fed Chair Warsh testifying to Congress same day. If in-line or cooler, R could improve to neutral (0). If hot, the recovery stalls. **This is a critical week: CPI + Fed testimony + ASML/TSM earnings + big banks + Crypto Clarity Act field hearing.**
8. **Crypto Clarity Act** — Senate may release merged bill week of July 20 (CoinPaprika). Ethics fight stalling (The Hill, CryptoNews). CFTC Chair says "must-pass." SEC may start rulemaking before Senate votes. Major positive catalyst for the entire crypto complex.
