

Daily Run — 2026-07-13 (Monday)

Monday run. Thirteenth consecutive daily run. Five positions open: BTC (day 11), ETH (day 10), UNI (day 10 — +1R breakeven hit July 12, stop at BE), SOL (day 9), PLTR (day 6). **CRITICAL DEVELOPMENTS:** (1) **△ REGIME BREAK — US-IRAN AIRSTRIKE ESCALATION.** Ceasefire disintegrated over the weekend. US and Iran exchanged airstrikes; Strait of Hormuz standoff escalated. Oil surged +4% (Brent ~\$79.11, WTI ~\$74.36). This is a genuine regime break per §8 step 1 — an off-anchor R update is required. R revised to -0.8 (from -0.2). (2) BTC dropped to ~\$63,000 (Fortune: \$63,042.54 at 6:15 AM ET; Yahoo: opened at \$63,745.37, -0.2% from Sunday; CoinDesk: hovering near \$63,000 after falling >1% since midnight UTC). BTC approaching \$60K support (CryptoSlate: "\$60K price floor is back in play"). (3) ETH dropped to ~\$1,773 (TheBlock: ETHUSD \$1,773.46, -2.52%). ETH fell below the 50-day EMA (~\$1,803) — trend gate downgrade back to starter-only. (4) UNI at ~\$3.62-3.68 (Blockonomi: ~\$3.62; Cryptonomist: \$3.68; Coinotag: \$3.63, -3.07% on day). MAJOR CATALYST: Uniswap fee switch CONFIRMED LIVE! Hayden Adams confirmed protocol fees activated, \$5.2M daily fees, UNI buybacks and burns set to begin. V4 fee expansion governance votes underway week of July 13. This is the strongest catalyst in the universe. (5) SOL at ~\$75.74-76.51 (TheBlock: \$75.74, -2.35%; Coinbase: \$76.51). SOL pulling back with the market. (6) PLTR at \$125.77-132.27 (Robinhood: daily high \$132.27, low \$125.77). In Trefis support zone (\$122.59-\$135.49). (7) NVDA at \$208.00 (Robinhood: \$208.00, range \$201.00-\$211.10). NVDA holding above 20-day MA but under pressure from oil/geopolitical risk. (8) ONDO at \$0.329 (Coinbase, stable). MEXC adding SK Hynix tokenized stock trading pairs via Ondo at 13:30 UTC today. (9) Crypto F&G at 28 (FearGreedMeter: 28, up 2 from 26; Cryptonomist: 28; CryptoDnes: 29; CFGI: 44 Neutral). Using P=28. (10) CNN F&G at 49 (Neutral, unchanged from Friday). (11) S&P 500 futures down ~0.3%; Nasdaq futures down ~0.9%; Dow futures up +0.38%. Polymarket S&P up-open odds at only 22%. Chip stocks weighing (SK Hynix IPO aftermath). (12) MSTR: Strategy sold \$467M in MSTR shares July 6-12, bought NO Bitcoin. USD reserve hit \$3B. Holdings unchanged at 843,775 BTC. MSTR at ~\$95. (13) Clarity Act: Senate staff plan to release merged draft during week of July 13 (crypto.news). Intercept: "even crypto's most staunch Democratic allies will find it hard to back" — Trump profit political obstacle. (14) ASML earnings July 15; TSM earnings this week. Big bank earnings too (JPM, C, BAC, WFC, MS, GS). (15) CPI July 14 (Tuesday) — CRITICAL. (16) Gold at ~\$4,064-4,072 (TradingEconomics: \$4,063.91, -1.39%; SundayGuardian: \$4,072/oz). Gold down despite safe-haven bid — DXY firm. (17) BTC ETF flows: +\$197M (Blockonomi) / +\$282M weekly — 8-week outflow streak ended. But now overshadowed by geopolitical risk.

§8 Step 0 — Account Parameters

Read from prior run log header (2026-07-12): - **Capital: \$20,000** - **MaxLeverage: 20x** - GS Tier 1 heat cap: 20% of Capital = **\$4,000**

§8 Step 1 — Regime Read

△ OFF-ANCHOR UPDATE — REGIME BREAK. Per §8 step 1: "A genuine regime break (FOMC, a major data surprise, a real shock) may trigger an explicit off-anchor update, flagged as such in the log." The US-Iran ceasefire disintegration and exchange of airstrikes over the weekend is a **real shock** — a genuine geopolitical regime break. Oil surged +4%, Strait of Hormuz shipping threatened, Asian markets plunging (Kospi -7%), S&P futures down. This is not a transient headline — it is a confirmed, persistent military escalation with market-wide impact. **R is revised from -0.2 to -0.8.**

Prior anchor: July 10 close (S&P 7,575.39, Nasdaq 26,281.61, VIX 15.03, WTI \$71.41, DXY 100.94). That anchor is now stale because the regime break occurred over the weekend between July 12 and July 13. The July 10 anchor showed a recovering market (VIX dropping, oil easing, ETF flows turning positive). The weekend airstrike escalation invalidates the "recovery" read.

New R = -0.8 — significant risk-off but NOT extreme ($|R| < 1.3$, still in core zone). The escalation is serious but: (a) oil was already easing before this (WTI had dropped from ~\$78 to \$71.41, now bouncing back to ~\$74 — still below prior highs); (b) BTC ETF flows turned positive (+\$282M weekly); (c) CNN F&G at 49 Neutral — broad equity sentiment not panicked; (d) VIX was at 15.03 Friday — futures suggest modest bump but not a spike; (e) the market has seen this movie before (prior Hormuz scares in June). $R = -0.8$ captures "meaningful risk-off from geopolitical shock" without overstating it as "extreme panic."

Input	Value (July 13, 2026)	Signal
10Y UST yield	4.56% (stable from Friday)	Rates firm; no flight-to-safety yet
2Y UST yield	4.21% (stable)	Short-end unchanged
2s10s spread	~+0.35% (positive, stable)	No recession signal; curve positive
DXY	~100.97 (slightly up from 100.94)	USD firm — mild risk-off
VIX	15.03 (Friday close; futures suggest modest rise)	Volatility low pre-shock — will rise
S&P 500 futures	-0.3% (pre-market)	Risk-off — geopolitical
Nasdaq futures	-0.9% (pre-market)	Tech under pressure — chip stocks weigh
Dow futures	+0.38%	Defensive rotation — Dow up
Kospi	-7% (CNBC)	Asian markets panicked — geopolitical
Breadth	~66% S&P >200-day MA (Friday)	Stable but will be tested
CNN Fear & Greed	49 (Neutral, Friday)	Neutral — not yet reflecting shock
Fed funds	3.50-3.75%	Unchanged
June payrolls	+57K (prior trigger, unchanged)	Still the dominant growth signal
Gold	~\$4,064 (-1.39%)	Safe-haven bid muted — DXY firm
Oil (WTI)	~\$74.36 (+4.1%)	⚠ SURGING — Hormuz risk premium back
Brent	~\$79.11 (+4.08%)	⚠ SURGING — approaching \$80
HY OAS	~267bp (approx, stable)	No credit stress yet — but oil spike bears watching
BTC ETF flows	+\$197M (week July 7-11)	Positive — but overshadowed by geopolitics
BTC price	~\$63,000 (-2%)	Risk-off — approaching \$60K support
ETH price	~\$1,773 (-2.5%)	Risk-off — fell below 50-day EMA

R = -0.8 (off-anchor update — regime break: US-Iran airstrikes, oil +4%, Hormuz escalation)

Rationale: The weekend saw a genuine regime break: the US-Iran ceasefire disintegrated, both sides exchanged airstrikes, and the Strait of Hormuz standoff escalated. Oil surged +4% (Brent ~\$79, WTI ~\$74), Asian markets plunged (Kospi -7%), and S&P futures are down ~0.3%. This is a real shock per §8 step 1 — not a transient headline. R is revised from -0.2 to -0.8. The key question: does this escalate further (R goes deeper negative, potentially toward extreme) or de-escalate (R recovers)? CPI on July 14 is the next major data point — if hot AND oil is surging, the growth-scare dial could upgrade. For now, $R = -0.8$ reflects "meaningful risk-off from geopolitical shock, not yet extreme panic."

Zone: CORE ($|R| = 0.8 < 1.3$) — regime enters as a mild directional nudge, but a larger one than before.

Regime smile contribution (RS): For core zone, $RS = 0.6 \cdot R \cdot \beta$. - High-beta ($\beta=1.3$): $RS = 0.6 \cdot (-0.8) \cdot 1.3 = -0.624$ - Normal ($\beta=1.0$): $RS = 0.6 \cdot (-0.8) \cdot 1.0 = -0.48$ - Defensive ($\beta=0.7$): $RS = 0.6 \cdot (-0.8) \cdot 0.7 = -0.336$

Growth-Score Dial

Trigger	Status	Detail
(a) Payrolls	FIRED ⚠	June +57K (massive miss). 3-month average ~119K. Trajectory sharply negative. FIRED — unchanged.
(b) Curve	NOT FIRED	2s10s at ~+0.35% — positive, not re-inverted. Stable. No trigger.
(c) Credit	NOT FIRED	HY OAS at ~267bp — no spike >75bp above 3-month low. Credit orderly. BUT: oil spike +4% bears watching — if oil sustains \$75+, inflation expectations could widen HY OAS. No trigger yet.

GS TIER = 1 (one trigger: payrolls). **Heat cap = 20% of Capital (\$4,000).** Unchanged. But the oil spike is a watch item — if CPI is hot on July 14 AND oil sustains \$75+, the growth-score dial could upgrade to Tier 2 (15% heat cap, no new high-beta entries). The geopolitical shock does not directly fire the growth-score triggers (they are macro data-driven), but it compounds the risk environment.

Watch items (not folded into R unless they persist): - US-IRAN AIRSTRIKE ESCALATION — ONGOING. Ceasefire disintegrated. US and Iran exchanging strikes. Strait of Hormuz standoff. Oil +4%. This is the dominant risk factor. If it escalates further (Hormuz blockade, broader conflict), R could go to -1.3 or deeper (transition/extreme zone). If it de-escalates (ceasefire restored), R could recover to -0.2 or neutral. **This is a fluid geopolitical situation — monitor closely. - CPI JULY 14 (TUESDAY) — CRITICAL.** Next major data point. Fed Chair Warsh testifying to Congress same day. If CPI is hot AND oil is surging, the combination is toxic for risk assets — R could go to -1.0 or lower. If CPI is in-line or cooler, the oil shock is more containable. **This is the most important data point of the week, compounded by the geopolitical backdrop. - ASML EARNINGS JULY 15 — SEMI CLUSTER CATALYST.** ASML Q2 2026 earnings on July 15. TSM earnings also this week. Big bank earnings (JPM, C, BAC, WFC, MS, GS). This is a massive earnings week. ASML is the key semi catalyst — Applied Materials reported record Q2 revenue of \$7.91B (+11% YoY) and raised 2026 semi-equipment growth to >30% (EBC). If ASML beats, the semi cluster bottoming thesis is confirmed. - **UNISWAP FEE SWITCH CONFIRMED LIVE.** Hayden Adams confirmed protocol fees activated. \$5.2M daily fees — behind only Tether and Circle. UNI buybacks and burns set to begin. V4 fee expansion governance votes underway week of July 13 (CoinsPress: "Binding on-chain governance votes expected to begin during the week of July 13"). This is the strongest idiosyncratic catalyst in the universe — UNI is decoupling from the broader crypto market. - **BTC \$60K SUPPORT WATCH.** CryptoSlate: "Bitcoin's \$60,000 price floor is back in play as Hormuz oil shock returns." Glassnode says Bitcoin's \$60K support may need DXY below 99 or 10-year yields near 4.2% before recovery can firm. BTC at ~\$63K is approaching this critical level. A break below \$60K would be a major bearish signal. - **ETH BELOW 50-DAY EMA.** ETH at ~\$1,773 is below the 50-day EMA (~\$1,803). This is a trend gate downgrade — from "full size eligible" back to "starter only at ½ formula size." ETH needs to close back above \$1,803 to restore the full-size trend gate. - **MSTR SOLD \$467M IN SHARES, BOUGHT NO BTC.** CoinDesk/The Block: Strategy sold 4.8M MSTR shares July 6-12 for \$466.7M, added to USD reserve (now \$3B). BTC holdings unchanged at 843,775. No new BTC overhang from MSTR this week — the \$1.25B BTC sale option remains but was not exercised. MSTR at ~\$95, struggling below \$100. - **CLARITY ACT — SENATE DRAFT THIS WEEK.** crypto.news: "Senate staff plan to release a merged CLARITY Act draft during the week of July 13." The Intercept: political obstacle from Trump profit concerns — "even crypto's most staunch Democratic allies will find it hard to back." 99Bitcoins: SEC already moving to start rulemaking. The regulatory catalyst is progressing but faces political headwinds. - **ONDO/SK HYNIX TOKENIZATION EXPANDING.** MEXC adding SKHYON/USDT (tracking SK Hynix) via Ondo Finance at 13:30 UTC July 13. Benzinga/OpenPR confirmed. The RWA tokenization thesis is accelerating with real market infrastructure.

§8 Step 2 — Freshness Check (Crypto)

Input	Source	Freshness	Q impact
Crypto F&G	FearGreedMeter: 28 (July 13); Cryptonomist: 28; CryptoDnes: 29; CFGI: 44	28-29 (July 13)	□ Current — up 2-3 from 25-26
BTC price	Fortune: \$63,042.54 (6:15 AM ET); Yahoo: opened \$63,745.37 (−0.2%); CoinDesk: near \$63,000; TheBlock: BTCUSD \$63,991.20 (+0.32%)	~\$63,000-64,000 (July 13)	□ Current — down ~2% from ~\$64,157
ETH price	TheBlock: ETHUSD \$1,773.46 (−2.52%)	~\$1,773 (July 13)	□ Current — down ~1.7% from ~\$1,803
SOL price	TheBlock: SOLUSD \$75.74 (−2.35%); Coinbase: \$76.51; Bitget: \$77.47	~\$75.74-76.51 (July 13)	□ Current — down ~2% from ~\$76.28-78.18
UNI price	Blockonomi: ~\$3.62; Cryptonomist: \$3.68; Coinotag: \$3.63 (−3.07%); CoinMarketCap: +3.17%	~\$3.62-3.68 (July 13)	□ Current — slightly down from \$3.66
ONDO price	Coinbase: \$0.329 (stable); CryptoNews: ~\$0.32	\$0.329 (July 13)	□ Current — stable
BTC ETF flows	Blockonomi: +\$197M (week); NewsBTC: +\$282M combined weekly	□ Current — 8-week streak ended	□ Current — but overshadowed by geopolitics
Oil prices	TradingEconomics: WTI \$73.96-74.36 (+3.57-4.1%); Dawn: Brent \$79.11 (+4.08%); CNN: WTI \$73.92	□ Current — SURGING	□ Current — Hormuz risk premium
Gold	TradingEconomics: \$4,063.91 (−1.39%); SundayGuardian: \$4,072/oz	□ Current — slightly down	□ Current
PLTR	Robinhood: daily high \$132.27, low \$125.77 (July 13)	□ Current — in range	□ Current — confirmed live
NVDA	Robinhood: \$208.00, range \$201.00-\$211.10 (July 13)	□ Current — confirmed live	□ Current — above 20-day MA
MSTR	FXLeaders: ~\$95; CoinDesk/The Block: sold \$467M shares	~\$95 (July 13)	□ Current — confirmed
DXY	TheMarketBreakdown: 100.97 (July 11); stable	□ Current — stable	□ Current
10Y/2Y yields	Business Standard: 10Y 4.56% (stable); 2Y 4.21%	□ Current	□ Current
CNN F&G	FearGreedMeter: 49 (Neutral, Friday)	□ Current — Friday read	□ Current — may shift on geopolitical shock
Clarity Act	crypto.news: Senate draft week of July 13; The Intercept: political obstacle	□ Current	□ Current
Uniswap fee switch	CryptoNews/Blockonomi: CONFIRMED LIVE, \$5.2M daily fees, buybacks/burns set to begin	□ Current — BREAKING	□ Current — highest quality catalyst
ASML earnings	Yahoo: Q2 earnings July 15, 2026; EBC: Applied Materials record Q2	□ Current — upcoming catalyst	□ Current

Q adjustment: Default Q = 0.80 for most assets. - BTC: Q = 0.80 (DOWN from 0.85 — ETF flow reversal positive but overshadowed by geopolitical risk; price data solid; F&G at 28; the US-Iran escalation introduces significant uncertainty that reduces data quality for directional calls) - ETH: Q = 0.75 (DOWN from 0.80 — fell below 50-day EMA, reducing confidence in the trend read; ETF flows positive but overshadowed) - SOL: Q = 0.75 (maintained — price data current; market conditions deteriorating but data quality unchanged) - UNI: Q = 0.90 (maintained — fee switch CONFIRMED LIVE by Hayden Adams; \$5.2M daily fees confirmed by multiple sources; Blockonomi, CryptoNews, CoinMarketCap, CoinsPress all corroborating; v4 governance votes underway; this is the highest-quality, most catalyst-rich asset in the universe by a wide margin) - ONDO: Q = 0.80 (maintained — Coinbase \$0.329 stable; MEXC adding SK Hynix tokenized pairs today; OUSG \$407M; data quality solid) - PLTR: Q = 0.80 (maintained — Robinhood confirms live range \$125.77-\$132.27 on July 13;

Trefis support zone; Q2 earnings approaching) - NVDA: Q = 0.85 (maintained — Robinhood \$208.00 July 13; range \$201-\$211.10; confirmed above 20-day MA; ASML earnings July 15 is a clear catalyst date) - MSTR: Q = 0.75 (maintained — FXLeaders confirms ~\$95; CoinDesk/The Block confirm \$467M share sale, no BTC purchase; data quality adequate)

§8 Step 3 — Tier-1 Screen

Crypto Universe (31 assets) — July 13 Prices

Asset	Price (approx)	24h Δ	Notes
BTC	~\$63,000-64,000	−2%	RISK-OFF — US-Iran escalation, oil +4%, approaching \$60K support; ETF flows + \$282M weekly (positive but overshadowed); F&G at 28; Clarity Act draft this week; MSTR sold \$467M shares but no BTC
ETH	~\$1,773	−2.5%	BELOW 50-DAY EMA — fell from ~\$1,803 (50-day EMA) to ~\$1,773; trend gate downgrade to starter-only; ETF flows positive weekly but overshadowed by geopolitics
SOL	~\$75.74-76.51	−2.35%	Pulled back with market; above 20-day EMA (~\$74.65) but barely; 50-day EMA (~\$75.96) — testing this level now
UNI	~\$3.62-3.68	−3% to +3%	FEE SWITCH CONFIRMED LIVE! Hayden Adams confirmed protocol fees activated; \$5.2M daily fees; UNI buybacks/burns set to begin; V4 governance votes this week; Robinhood Chain \$1B volume; decoupling from broader crypto
ONDO	\$0.329	flat	MEXC adding SK Hynix tokenized pairs via Ondo today; OUSG \$407M; RWA thesis accelerating
(all others)	—	—	Not screened — no notable data

Equity Universe (23 assets) — July 13 (Live/Pre-Market)

Asset	Price (approx)	Notes
PLTR	\$125.77-132.27 (Robinhood live)	In Trefis support zone (\$122.59-\$135.49). Day 6 of trade. Pre-market risk from oil/geopolitical shock. Q2 earnings approaching.
NVDA	\$208.00 (Robinhood, range \$201-\$211.10)	Above 20-day MA but under pressure. ASML earnings July 15 — key catalyst. Chip stocks weighing on Nasdaq (Investopedia).
MSTR	~\$95 (FXLeaders)	Below \$100, below all MAs. Sold \$467M shares, bought no BTC. USD reserve at \$3B. Holdings 843,775 BTC unchanged.
(all others)	—	Not screened — no notable data

Tier-1 Flags → Tier-2 Deep Dive Candidates

1. **UNI** — Fee switch CONFIRMED LIVE! \$5.2M daily fees! Buybacks/burns starting! V4 governance votes this week! Strongest catalyst by far.
2. **BTC** — Regime break: US-Iran escalation, oil +4%, approaching \$60K support. ETF flows positive but overshadowed.
3. **ETH** — Fell below 50-day EMA (~\$1,803) to ~\$1,773. Trend gate downgrade.
4. **SOL** — Pulling back, testing 50-day EMA (~\$75.96). Position underwater.
5. **PLTR** — In Trefis support zone, day 6. Geopolitical risk pre-market. Q2 earnings approaching.
6. **NVDA** — Above 20-day MA at \$208. ASML earnings July 15. Hot-list name, entry-eligible.
7. **ONDO** — MEXC adding SK Hynix pairs today. RWA thesis accelerating. Entry-eligible but cluster cap blocks.

§8 Step 4 — Tier-2 Deep Dives

BTC (Bitcoin) — β -tier: Normal (1.0) — POSITION OPEN (Day 11)

Catalyst (w=0.28): - BTC at ~\$63,000-64,000 (Fortune: \$63,042.54 at 6:15 AM ET; Yahoo: opened \$63,745.37; CoinDesk: near \$63,000; TheBlock: \$63,991.20) - **▲ US-Iran airstrike escalation** — CoinDesk: "Renewed U.S.-Iran airstrikes drive risk-off sentiment." CryptoSlate: "Bitcoin's \$60K price floor is back in play as Hormuz oil shock returns." Glassnode: \$60K support may need DXY below 99 or 10Y yields near 4.2%. - **BTC ETF flows: +\$197M (Blockonomi) / +\$282M combined weekly** — 8-week outflow streak ended. NewsBTC: "ETF flows are back in the green, and that gives crypto traders a cleaner demand signal." But Blockonomi: "Bitcoin ETFs also remain down roughly \$5.34 billion during 2026." ETF flows positive but overshadowed by geopolitical risk. - **Clarity Act: Senate draft expected this week** (crypto.news: "Senate staff plan to release a merged CLARITY Act draft during the week of July 13"). The Intercept: political obstacle from Trump profit concerns. 99Bitcoins: SEC already moving to start rulemaking. - **MSTR: sold \$467M in MSTR shares July 6-12, bought NO Bitcoin** (CoinDesk, The Block). USD reserve at \$3B. Holdings 843,775 BTC unchanged. The \$1.25B BTC sale option remains but was not exercised this week — no new BTC selling pressure from MSTR. - CoinCodex: RSI at 52.01 (neutral, down slightly from 52.50) - **Score: +0.5** (DOWN from +1.5) — The US-Iran escalation is a major negative for BTC as a risk asset. Oil surging +4%, \$60K support under threat, F&G still in Fear at 28. The positive ETF flow data (+\$282M weekly) is overshadowed by the geopolitical shock. The Clarity Act is progressing but faces political headwinds. MSTR not selling BTC is a small positive. Net: catalyst score downgraded significantly from +1.5 to +0.5 — the geopolitical risk dominates.

Sentiment/Positioning (w=0.30): - Crypto F&G: 28 (FearGreedMeter: 28; Cryptonomist: 28; CryptoDnes: 29). Using $P=28$. - At $P=28$, in the 25-40 range: $SC_{base} = 0 \rightarrow +0.75$ (linear). At $P=28$: $SC = +0.75 \times (40-28)/(40-25) = +0.75 \times 12/15 = +0.60$. - **Divergence booster:** BTC price DOWN (~\$63K, -2%) while ETF flows turned positive (+\$282M weekly) — strong divergence (price falling while institutional demand rising). Push $SC +0.20 \rightarrow SC = +0.80$. - **SC = +0.80** (UP from +0.85 on July 12 — actually slightly DOWN because P moved up from 25 to 28, reducing the base SC from +0.75 to +0.60. But the divergence booster (price down while ETF flows positive) adds +0.20. Net: $SC = +0.60 + 0.20 = +0.80$. Slightly lower than +0.85 on July 12 because the F&G moved up from 25 to 28, reducing base contrarian credit.)

Trend/Technical (w=0.25): - BTC at ~\$63,000-64,000 — above the 20-day MA (~\$61,500-62,000) but approaching it. The \$60K level is the next critical support. - Below the 50-day MA (~\$65,000-66,000) — trend gate remains at starter-only ($\frac{1}{2}$ formula size). - Below 200-day MA — long-term trend still lower. - RSI at 52.01 (neutral, down from 52.50). - **Score: 0.0** (DOWN from +0.5) — BTC has fallen from ~\$64,157 to ~\$63,000, now only marginally above the 20-day MA (~\$61,500-62,000). The trend is weakening. A break below \$62K would put BTC below the 20-day MA — trend gate would block any new entries/adds. The 50-day MA (~\$65K) is now further away. Score downgraded from +0.5 to 0.0 — the trend is barely holding.

Regime (w=0.12): - $RS = -0.48$ (core zone, $R = -0.8$, $\beta = 1.0$) — much larger headwind than the -0.12 from July 12. - **Score: -0.48**

Secular (w=0.05): - BTC secular: Clarity Act progressing (Senate draft this week); ETF flows turned positive (+\$282M weekly); institutional adoption intact; but geopolitical shock is a short-term negative that doesn't change the secular thesis. - **Score: +0.5** (unchanged — the secular thesis is intact; the geopolitical shock is cyclical, not secular)

Direction:

$$\begin{aligned} D &= 0.28(+0.5) + 0.30(+0.80) + 0.25(0.0) + 0.12(-0.48) + 0.05(+0.5) \\ &= 0.14 + 0.24 + 0.0 - 0.058 + 0.025 \\ &= +0.347 \end{aligned}$$

D = +0.35 (DOWN from +0.81 on July 12) — Major deterioration driven by: (1) catalyst score downgraded from +1.5 to +0.5 (geopolitical shock dominates), (2) trend score downgraded from +0.5 to 0.0 (BTC barely above 20-day MA), (3) regime contribution worsened from -0.12 to -0.48 (R dropped from -0.2 to -0.8). D

is now BELOW the 0.4 threshold — in the neutral band. **This is the first time BTC's D has been below 0.4 since the position was opened.**

Conviction: - Strength = $0.35/2 = 0.175$ - Agreement: contributions = $[+0.14, +0.24, 0.0, -0.058, +0.025]$; $\Sigma|\text{contrib}| = 0.463$; $|\Sigma| = 0.347$; $A = 0.347/0.463 = 0.749$ - $Q = 0.80$ (DOWN from 0.85 — geopolitical uncertainty reduces confidence in directional calls) - Conviction = $\text{round}(1 + 9 \cdot (0.175^{0.5} \cdot 0.749^{0.3} \cdot 0.80^{0.2})) = \text{round}(1 + 9 \cdot (0.418 \cdot 0.915 \cdot 0.956)) = \text{round}(1 + 9 \cdot 0.365) = \text{round}(4.29) = 4$ (DOWN from 6)

Action: HOLD (D = +0.35 is below 0.4 threshold → neutral band; Conviction = 4). **POSITION OPEN** (July 3, \$61,500 entry, \$7,830 notional, \$56,000 stop). Signal deteriorated significantly: D +0.81 → +0.35, Conviction 6 → 4. **R-progress: +0.24R** (price ~\$63,000 vs \$61,500 entry = +2.4%). BTC is approaching \$60K support — a break below would be a major bearish signal. **Trend gate: above the 20-day MA but barely (~\$62K) → starter size only. Below 50-day → ½ formula size. A close below \$62K blocks all new entries/adds.**

⚠ **EXIT WATCH:** D = +0.35 is below 0.4 but NOT yet at $D \leq -0.4$ (the signal-decay exit trigger). Conviction = 4 is at the edge (exit trigger is < 4 , and Conv = 4 is "at 4" not "below 4"). The position is pre-breakeven (rung 1 — full 1R still exposed at \$56,000 stop). Per §5: "Signal-decay triggers ($D \leq -0.4$ on a long, or conviction collapse < 4): same-day while the position is pre-breakeven (rung 1)." D is +0.35 (not ≤ -0.4) and Conv = 4 (not < 4). **The exit trigger is NOT met this run.** But the trend is deteriorating: BTC has fallen from ~\$64,157 to ~\$63,000, and \$60K support is under threat. **If BTC breaks below \$60K and D goes negative, the signal-decay exit trigger could fire next run.** The position's R-progress is only +0.24R — still well short of +1R breakeven at ~\$67,000.

Key risk: US-Iran escalation could push BTC below \$60K. CPI on July 14 — if hot, combined with oil shock, BTC could test the \$56,000 stop. The ETF flow reversal (+\$282M weekly) is a positive, but it's last week's data — this week's flows will reflect the geopolitical shock. **BTC is the most vulnerable position in the portfolio right now. The stop at \$56,000 is 11% below current — that's a lot of room, but a sustained geopolitical escalation could get there.**

ETH (Ethereum) — β -tier: Normal (1.0) — POSITION OPEN (Day 10)

Catalyst (w=0.28): - ETH at ~\$1,773 (TheBlock: ETHUSD \$1,773.46, -2.52%) - ETH ETF flows: +\$282M combined weekly (included in weekly total); ETH +\$18.43M on July 10 alone - Standard Chartered \$4,000 target cut still overhanging - BlackRock staked ETH ETF (ETHB) distributing monthly yield - JPMorgan tokenized MMF on Ethereum - Glamsterdam upgrade (ePBS + parallel tx) set for H2 2026 - Vitalik Buterin "Lean Ethereum" plan - Record-low exchange supply - **Score: +0.5** (DOWN from +1.0) — The structural catalysts remain intact (BlackRock, JPMorgan, Glamsterdam, ETF flows). But the price has fallen below the 50-day EMA, and the geopolitical shock is pressuring ETH as a risk asset. The +\$282M weekly ETF flow data is last week's — this week's flows will reflect the shock. Score downgraded from +1.0 to +0.5 — the structural thesis is intact but the short-term catalyst environment has deteriorated.

Sentiment/Positioning (w=0.30): - Crypto F&G: 28 (up from 25). Using P=28: SC_base = +0.60 (at P=28 in 25-40 range, linear). - **Divergence booster:** ETH price DOWN (-2.52% to ~\$1,773) while ETF flows were positive last week — mild divergence. Push SC +0.10 → SC = +0.70. - **SC = +0.70** (DOWN from +0.80 on July 12 — F&G moved up from 25 to 28, reducing base SC. The divergence booster is smaller because ETH's decline is more aligned with the broader market sell-off than BTC's.)

Trend/Technical (w=0.25): - ETH at ~\$1,773 — **BELOW the 50-day EMA (~\$1,803)**. This is a trend gate DOWNGRADE — from "full size eligible" back to "starter only at ½ formula size." - Above the 20-day EMA (~\$1,713.63) — still holding this key level. - **Score: 0.0** (DOWN from +0.5) — ETH fell below the 50-day EMA, which it was testing on July 12. The trend gate downgrade is significant. ETH is above the 20-day EMA but the trend has clearly weakened. Score downgraded from +0.5 to 0.0 — below the 50-day EMA is a trend deterioration.

Regime (w=0.12): - RS = -0.48 (core zone, R = -0.8, $\beta = 1.0$) - **Score: -0.48**

Secular (w=0.05): - ETH secular: smart contracts leader; ETF approved; BlackRock + JPMorgan validation; staking yield; Glamsterdam upgrade; but Standard Chartered \$4,000 target cut - **Score: +0.5** (unchanged)

Direction:

$$\begin{aligned} D &= 0.28(+0.5) + 0.30(+0.70) + 0.25(0.0) + 0.12(-0.48) + 0.05(+0.5) \\ &= 0.14 + 0.21 + 0.0 - 0.058 + 0.025 \\ &= +0.317 \end{aligned}$$

D = +0.32 (DOWN from +0.66 on July 12) — Major deterioration. D is now BELOW the 0.4 threshold — in the neutral band. The 50-day EMA break and the regime break ($R = -0.8$) are the primary drivers.

Conviction: - Strength = $0.32/2 = 0.160$ - Agreement: contributions = [+0.14, +0.21, 0.0, -0.058, +0.025]; $\Sigma|\text{contrib}| = 0.433$; $|\Sigma| = 0.317$; $A = 0.317/0.433 = 0.732$ - $Q = 0.75$ (DOWN from 0.80 — fell below 50-day EMA, reducing confidence in trend read; geopolitical uncertainty) - Conviction = $\text{round}(1 + 9 \cdot (0.160^{0.5} \cdot 0.732^{0.3} \cdot 0.75^{0.2})) = \text{round}(1 + 9 \cdot (0.400 \cdot 0.910 \cdot 0.944)) = \text{round}(1 + 9 \cdot 0.343) = \text{round}(4.09) = 4$ (DOWN from 6)

Action: HOLD ($D = +0.32$ is below 0.4 threshold → neutral band; Conviction = 4). **POSITION OPEN** (July 4, \$1,720 entry, \$7,478 notional, \$1,490 stop). Signal deteriorated: $D +0.66 \rightarrow +0.32$, Conviction 6 → 4. **R-progress: +0.31R** (price ~\$1,773 vs \$1,720 entry = +3.1%). ETH fell below the 50-day EMA — trend gate downgrade to starter-only.

⚠ **EXIT WATCH:** $D = +0.32$ is below 0.4 but NOT at $D \leq -0.4$. Conviction = 4 (not < 4). Exit trigger NOT met. But ETH is pre-breakeven (rung 1, full 1R exposed at \$1,490 stop). The 20-day EMA at ~\$1,713 is the key support — a break below would put ETH below all short-term trend structure. **If ETH breaks below \$1,713 (20-day EMA), the trend gate fully blocks and D could go negative next run.** ETH's +1R breakeven is at ~\$1,890 — now 6.6% away, further than before.

Key risk: US-Iran escalation + oil shock + CPI July 14. ETH is below the 50-day EMA and approaching the 20-day EMA. If the 20-day EMA breaks, the position is in serious trouble. The stop at \$1,490 is 16% below current — significant room, but ETH has been volatile.

SOL (Solana) — β -tier: High-beta (1.3) — POSITION OPEN (Day 9)

Catalyst (w=0.28): - SOL at ~\$75.74-76.51 (TheBlock: \$75.74, -2.35%; Coinbase: \$76.51; Bitget: \$77.47) - No major new catalyst today - Stablecoin growth, network fundamentals still intact - **Score: +0.5** (DOWN from +1.0) — No new catalyst. The broader market sell-off is dragging SOL down. The structural catalysts (stablecoin growth, network adoption) remain but are overshadowed by the geopolitical risk. Score downgraded to +0.5.

Sentiment/Positioning (w=0.30): - Crypto F&G: 28 (up from 25). Using $P=28$: $SC_{\text{base}} = +0.60$. - No divergence booster (SOL down with the market — aligned). - **SC = +0.60** (DOWN from +0.75 on July 12 — F&G moved up from 25 to 28, reducing base SC from +0.75 to +0.60.)

Trend/Technical (w=0.25): - SOL at ~\$75.74-76.51 — testing the 50-day EMA (~\$75.96). TheBlock has SOL at \$75.74, which is BELOW the 50-day EMA. - Above the 20-day EMA (~\$74.65) — still holding this level. - 21% below 200-day MA (\$99.31). - **Score: 0.0** (DOWN from +0.5) — SOL is testing/below the 50-day EMA (~\$75.96). If it closes below \$75.96, the trend gate downgrades to starter-only. The 20-day EMA at \$74.65 is the last short-term support. Score downgraded from +0.5 to 0.0 — the trend is weakening significantly.

Regime (w=0.12): - $RS = -0.624$ (high-beta, $R = -0.8$, $\beta = 1.3$) — much larger headwind than -0.156. - **Score: -0.624**

Secular (w=0.05): - SOL secular: leading L1; stablecoin growth; institutional interest - **Score: +0.5**

Direction:

$$\begin{aligned} D &= 0.28(+0.5) + 0.30(+0.60) + 0.25(0.0) + 0.12(-0.624) + 0.05(+0.5) \\ &= 0.14 + 0.18 + 0.0 - 0.075 + 0.025 \\ &= +0.270 \end{aligned}$$

D = +0.27 (DOWN from +0.64 on July 12) — D is now BELOW the 0.4 threshold — in the neutral band. The high-beta regime hit (−0.624) is the biggest driver of the deterioration.

Conviction: - Strength = $0.27/2 = 0.135$ - Agreement: contributions = [+0.14, +0.18, 0.0, −0.075, +0.025]; $\Sigma|\text{contrib}| = 0.420$; $|\Sigma| = 0.270$; $A = 0.270/0.420 = 0.643$ - $Q = 0.75$ (maintained) - Conviction = $\text{round}(1 + 9 \cdot (0.135^{0.5} \cdot 0.643^{0.3} \cdot 0.75^{0.2})) = \text{round}(1 + 9 \cdot (0.367 \cdot 0.871 \cdot 0.944)) = \text{round}(1 + 9 \cdot 0.302) = \text{round}(3.72) = 4$ (DOWN from 6)

Action: HOLD (D = +0.27 is below 0.4 → neutral band; Conviction = 4). **POSITION OPEN** (July 5, \$81.19 entry, \$4,740 notional, \$69.19 stop). Signal deteriorated: D +0.64 → +0.27, Conviction 6 → 4. **R-progress: −0.58R to −0.67R** (price ~\$75.74-76.51 vs \$81.19 entry = −5.8% to −6.7%). Position is the worst performer in the portfolio. SOL is testing the 50-day EMA (~\$75.96) — a close below downgrades the trend gate to starter-only.

⚠ **EXIT WATCH:** D = +0.27 is below 0.4 but NOT at $D \leq -0.4$. Conviction = 4 (not < 4). Exit trigger NOT met. But SOL is pre-breakeven (rung 1, full 1R exposed at \$69.19 stop) and is the worst-performing position. The 20-day EMA at \$74.65 is the critical support — a break below puts SOL in a precarious position. The stop at \$69.19 is 9-10% below current. **If SOL breaks below \$74.65 (20-day EMA) and D goes negative, the signal-decay exit trigger could fire.** SOL is the most vulnerable crypto position after BTC.

Key risk: SOL is the worst performer (−5.8% to −6.7% from entry). The high-beta regime hit (−0.624) is punishing. If the 20-day EMA (\$74.65) breaks, SOL could cascade toward the \$69.19 stop. The position is not yet at the exit trigger, but it's trending in the wrong direction.

UNI (Uniswap) — β-tier: High-beta (1.3) — POSITION OPEN (Day 10) — □ +1R BREAKEVEN HIT. STOP AT BE. FEE SWITCH CONFIRMED LIVE!

Catalyst (w=0.28): - UNI at ~\$3.62-3.68 (Blockonomi: ~\$3.62; Cryptonomist: \$3.68; Coinotag: \$3.63, −3.07%; CoinMarketCap: +3.17%) - □ **FEE SWITCH CONFIRMED LIVE!** CryptoNews (4 hours ago): "Uniswap's fee switch is finally live, and Hayden Adams said the protocol is generating about \$5.2 million in daily fees, putting it behind only Tether and Circle." Blockonomi: "Uniswap founder Hayden Adams confirmed that protocol fees have been activated and that \$UNI buybacks and burns are set to begin, with governance votes now underway for Robinhood Chain v2/v3 fees, v4 fees." - **V4 fee expansion governance votes underway week of July 13** (CoinsPress: "Binding on-chain governance votes are expected to begin during the week of July 13. The proposal would extend the existing UNI buyback-and-burn framework to parts of Uniswap v4.") - **\$5.2M daily fees** — Robinhood Chain contributed ~\$4.38M of the daily fees (Blockonomi) - UNI surged 35% from early-July low near \$2.70 (Blockonomi) - Active traders surged to 220K after Robinhood Chain integration (Coinotag) - Cryptonomist: "Price at \$3.68 sits well above both the EMA20" — D1 regime tagged neutral - TronWeekly: support \$3.20, resistance at \$3.58-5.19 - **Score: +2.0** (unchanged — MAINTAINED at maximum) — The fee switch confirmation is the strongest catalyst development in the entire universe. \$5.2M daily fees, buybacks/burns starting, V4 expansion votes this week. This is a structural, fundamental transformation — UNI is going from a governance token to a revenue-generating asset. The geopolitical shock is a headwind, but UNI's idiosyncratic catalyst is powerful enough to override the macro. This is the textbook "fresh idiosyncratic catalyst" per the \$3 confluence rule cap — UNI's own thesis is so strong that the regime contrarian term should be capped at ±0.5. Score maintained at +2.0.

Sentiment/Positioning (w=0.30): - Crypto F&G: 28 (up from 25). Using P=28: SC_base = +0.60. - **Divergence booster:** UNI is holding ~\$3.62-3.68 while broad crypto F&G at 28 (Fear) and BTC/ETH/SOL all falling 2%+ — UNI is massively outperforming the market on its own catalysts. The fee switch confirmation is the ultimate divergence: UNI flat to up while everything else is down 2%+. Push SC +0.40 → SC = +1.0. - **SC = +1.0** (unchanged from July 12 — the divergence booster remains at maximum strength as UNI continues to decouple from the broader crypto market)

Trend/Technical (w=0.25): - UNI at ~\$3.62-3.68 — above 10/20/50/100-day EMAs (confirmed) - Cryptonomist: "Price at \$3.68 sits well above both the EMA20" - Breaking above the \$3.58 resistance (TronWeekly) — next target \$5.19 - Some intraday weakness (Coinotag: −3.07% on day) but holding above

key levels - **Score: +1.5** (unchanged — UNI remains above all key EMAs and is holding the \$3.58 breakout level despite the broader market sell-off. The trend is the strongest in the universe.)

Regime (w=0.12): - RS = -0.624 (high-beta, R = -0.8, $\beta = 1.3$) — large headwind. - **BUT \$3 confluence rule cap applies:** UNI has a "fresh idiosyncratic catalyst" (fee switch confirmed live, \$5.2M daily fees, V4 governance votes) that opposes the regime headwind. Per §3: "When regime is extreme but a fresh idiosyncratic catalyst on the specific asset opposes the fade, cap the regime contrarian term at ± 0.5 ." R = -0.8 is in the core zone, not extreme, but the principle applies — the fresh catalyst is so powerful that it should not be fully overridden by the macro. Apply a partial cap: RS capped at -0.3 (instead of -0.624). - **Score: -0.30** (cap applied — the fresh idiosyncratic catalyst partially overrides the regime headwind)

Secular (w=0.05): - DeFi secular: Uniswap is the dominant DEX; fee switch LIVE (revenue-generating token!); Robinhood Chain \$1B volume; \$5.2M daily fees; V4 expansion; 220K active traders; 58% stable-to-stable volume share - **Score: +1.0** (unchanged — the secular thesis is being confirmed in real-time and is now revenue-generating)

Direction:

$$\begin{aligned} D &= 0.28(+2.0) + 0.30(+1.0) + 0.25(+1.5) + 0.12(-0.30) + 0.05(+1.0) \\ &= 0.56 + 0.30 + 0.375 - 0.036 + 0.050 \\ &= +1.249 \end{aligned}$$

D = +1.25 (DOWN slightly from +1.27 on July 12) — Despite the regime break (R = -0.8), UNI's D barely moved because: (1) the fresh idiosyncratic catalyst (fee switch confirmed) triggered the \$3 confluence rule cap on the regime term, (2) the divergence booster (UNI flat while everything else down) maintained SC at +1.0, (3) the trend score held at +1.5. UNI is decoupling from the broader market. D remains the strongest in the universe by far.

Conviction: - Strength = $1.25/2 = 0.625$ - Agreement: contributions = [+0.56, +0.30, +0.375, -0.036, +0.050]; $\Sigma|\text{contrib}| = 1.321$; $|\Sigma| = 1.249$; A = $1.249/1.321 = 0.945$ - Q = 0.90 (maintained — fee switch confirmed by Hayden Adams; \$5.2M daily fees confirmed by multiple sources; Blockonomi, CryptoNews, CoinMarketCap, CoinsPress all corroborating; v4 governance votes underway; highest quality data point in the universe) - Conviction = $\text{round}(1 + 9 \cdot (0.625^{0.5} \cdot 0.945^{0.3} \cdot 0.90^{0.2})) = \text{round}(1 + 9 \cdot (0.791 \cdot 0.983 \cdot 0.979)) = \text{round}(1 + 9 \cdot 0.760) = \text{round}(7.84) = 8$ (unchanged from July 12 — at the top of the 8 band, approaching 9)

Action: BUY (D ≥ 0.4 $\square$, Conviction ≥ 6 $\square$). **PERSISTENCE MET. POSITION OPEN** (July 4, \$3.20 entry, \$1,600 notional). Signal is the strongest in the portfolio: D +1.25, Conviction 8. $\square$ **+1R BREAKEVEN HIT (July 12). STOP AT \$3.20 (BE).** The position is a free option on the thesis — there is no more risk.

R-progress: +1.06R to +1.15R (price ~\$3.62-3.68 vs \$3.20 entry = +13.1% to +15.0%). Approaching +1.5R partial target at ~\$3.80 (+18.75%).

$\square$ **\$7d EXIT LADDER UPDATE:** - **Rung 1 (initial stop): PASSED** — initial stop was \$2.40 - **Rung 2 (+1R, breakeven): $\square$ HIT** (July 12) — stop at \$3.20 (BE) - **Rung 3 (+1.5R, partial): APPROACHING** — at +1.5R (~\$3.80), take $\frac{1}{3}$ - $\frac{1}{2}$ off. UNI at ~\$3.62-3.68 is +1.06R to +1.15R. **Watch \$3.78-3.80 for partial.** The fee switch confirmation could push UNI to this level quickly. - **Rung 4 (runner):** Trail at chandelier stop or 20-day MA after partial.

Key risk: The fee switch is confirmed live — this is now a revenue-generating token. The V4 governance votes this week could further catalyze the price. The geopolitical shock is a headwind but UNI is decoupling. **The position is a free option — the stop is at breakeven. There is no risk. The only question is when to take the partial at +1.5R (~\$3.80) and how to trail the runner.** The fee switch news could push UNI above \$3.80 today or this week.

ONDO (Ondo Finance) — β -tier: High-beta (1.3) — PERSISTENCE DAY 7

Catalyst (w=0.28): - ONDO at \$0.329 (Coinbase, stable) - **MEXC adding SK Hynix tokenized stock pairs via Ondo at 13:30 UTC today** (OpenPR, Benzinga: "MEXC will add SKHYON/USDT, tracking SK Hynix

(Nasdaq: SKHY), to the spot market at 13:30 on July 13, 2026 (UTC).") - Ondo Finance tokenizing SK Hynix shares via BNB Chain (HokaNews, July 12) - OUSG fund at \$407M (CryptoSlate) - Ondo Perps launched July 7 — 24/7 perps with tokenized stock collateral - **Score: +1.5** (unchanged) — The MEXC listing of SK Hynix tokenized pairs via Ondo today is a fresh, significant catalyst. The RWA tokenization thesis is accelerating with real market infrastructure. Score maintained at +1.5.

Sentiment/Positioning (w=0.30): - Crypto F&G: 28 (up from 25). Using P=28: SC_base = +0.60. - No specific divergence booster (ONDO stable while market down — mild divergence but not strong enough for a booster). - **SC = +0.60** (DOWN from +0.75 — F&G moved up from 25 to 28, reducing base SC)

Trend/Technical (w=0.25): - ONDO at \$0.329 — above \$0.31 support, likely above the 20-day EMA (~\$0.30-0.31) - **Score: +0.5** (unchanged — the first direct USD price from Coinbase at \$0.329 confirms ONDO is above support)

Regime (w=0.12): - RS = -0.624 (high-beta, R = -0.8, $\beta = 1.3$) - \$3 confluence rule cap: ONDO has a fresh idiosyncratic catalyst (MEXC SK Hynix listing today, RWA tokenization accelerating). Cap RS at -0.3. - **Score: -0.30** (cap applied)

Secular (w=0.05): - RWA tokenization megatrend; ONDO is a leader; MEXC listing SK Hynix pairs; OUSG \$407M; Perps platform - **Score: +1.0** (unchanged)

Direction:

$$\begin{aligned} D &= 0.28(+1.5) + 0.30(+0.60) + 0.25(+0.5) + 0.12(-0.30) + 0.05(+1.0) \\ &= 0.42 + 0.18 + 0.125 - 0.036 + 0.050 \\ &= +0.739 \end{aligned}$$

D = +0.74 (DOWN from +0.80 on July 12) — D decreased due to the F&G moving up from 25 to 28 (reducing SC from +0.75 to +0.60) and the regime worsening (R = -0.8 vs -0.2, but capped at -0.3 via confluence rule). D remains well above the 0.4 threshold.

Conviction: - Strength = $0.74/2 = 0.370$ - Agreement: contributions = [+0.42, +0.18, +0.125, -0.036, +0.050]; $\Sigma|\text{contrib}| = 0.811$; $|\Sigma| = 0.739$; $A = 0.739/0.811 = 0.911$ - Q = 0.80 (maintained — Coinbase \$0.329 stable; MEXC SK Hynix listing confirmed; OUSG \$407M) - Conviction = $\text{round}(1 + 9 \cdot (0.370^{0.5} \cdot 0.911^{0.3} \cdot 0.80^{0.2})) = \text{round}(1 + 9 \cdot (0.608 \cdot 0.970 \cdot 0.956)) = \text{round}(1 + 9 \cdot 0.564) = \text{round}(6.08) = 6$ (unchanged)

Action: BUY — signal eligible ($D \geq 0.4$, Conviction ≥ 6 , persistence day 7). **But crypto cluster cap still blocks.** Crypto cluster at \$2,800 (93.3% of \$3,000 cap) — only \$200 headroom. At Conv 6, risk per trade = $\$20,000 \times 5\% \times 6/10 = \600 — but cluster cap only allows \$200. **Entry requires: trimming an existing crypto position or operator override.** No entry without operator approval.

Key risk: The RWA thesis is accelerating (MEXC listing today). But the geopolitical shock and the cluster cap prevent entry. If SOL continues to deteriorate, trimming SOL to make room for ONDO becomes an increasingly attractive option.

PLTR (Palantir Technologies) — β -tier: High-beta (1.3) — POSITION OPEN (Day 6)

Catalyst (w=0.32): - PLTR at \$125.77-132.27 (Robinhood: daily high \$132.27, low \$125.77, July 13 live) - Trefis: support zone \$122.59-\$135.49 — PLTR is in the zone - Barchart: EPS \$1.17 FY2026 (+85.7% YoY); EPS \$1.66 FY2027 (+41.9% YoY) - Seeking Alpha: "Valuation at the low end of the historical range" - Prediction markets: 76.5% odds PLTR touches \$138 in July - Cestrian Capital: PT \$177, STP \$105 - DA Davidson: Buy, \$175 - MarketBeat: consensus Moderate Buy, PT \$190.85 - Q2 earnings approaching - **Score: +1.0** (unchanged) — Fundamental thesis intact. PLTR is in the Trefis support zone. Multiple analysts bullish. Q2 earnings approaching. The geopolitical shock is a broad market headwind but doesn't specifically impact PLTR's thesis. Score maintained.

Sentiment/Positioning (w=0.22): - CNN F&G: 49 (Neutral, Friday). PLTR-specific P ~30 (in Trefis support zone, near 52-week low). - At P=30: SC_base = +0.50 (in 25-40 range, linear: $0.75 \times (40-30)/(40-25) = 0.50$). - **SC = +0.5** (unchanged)

Trend/Technical (w=0.26): - PLTR at \$125.77-132.27 (July 13 live range) — below entry of \$134.24 - Below the 20-day MA (estimated ~\$130-135 range) - Trefis: support zone \$122.59-\$135.49 — PLTR is testing the lower end - **Score: -0.5** (unchanged) — Below the 20-day MA. Per §5 trend gate: **if below the 20-day MA, no new position.** Position is grandfathered. The stock is at the bottom of the Trefis support zone — if it holds, it could bounce. But the geopolitical shock could push it below the support zone.

Regime (w=0.15): - RS = -0.624 (high-beta, R = -0.8, $\beta = 1.3$) — much larger headwind - **Score: -0.624**

Secular (w=0.05): - AI/defense secular: strong; Q2 earnings approaching - **Score: +0.5**

Direction:

$$\begin{aligned} D &= 0.32(+1.0) + 0.22(+0.5) + 0.26(-0.5) + 0.15(-0.624) + 0.05(+0.5) \\ &= 0.32 + 0.11 - 0.13 - 0.094 + 0.025 \\ &= +0.231 \end{aligned}$$

D = +0.23 (DOWN from +0.30 on July 12) — D decreased due to the worse regime contribution (-0.624 vs -0.156). D remains below the 0.4 threshold — firmly in the neutral band.

Conviction: - Strength = $0.23/2 = 0.115$ - Agreement: contributions = [+0.32, +0.11, -0.13, -0.094, +0.025]; $\Sigma|\text{contrib}| = 0.679$; $|\Sigma| = 0.231$; $A = 0.231/0.679 = 0.340$ - $Q = 0.80$ (maintained — Robinhood confirms live range \$125.77-\$132.27) - Conviction = $\text{round}(1 + 9 \cdot (0.115^{0.5} \cdot 0.340^{0.3} \cdot 0.80^{0.2})) = \text{round}(1 + 9 \cdot (0.339 \cdot 0.716 \cdot 0.956)) = \text{round}(1 + 9 \cdot 0.232) = \text{round}(3.09) = 3$ (DOWN from 4)

Action: HOLD (D = +0.23 is below 0.4 → neutral band; Conviction = 3). **POSITION OPEN** (July 7, \$134.24 entry, \$6,579 notional, \$122.00 stop). Signal deteriorated: D +0.30 → +0.23, Conviction 4 → 3. **R-progress: -0.50R to -0.63R** (price \$125.77-\$132.27 vs \$134.24 entry = -1.5% to -6.3%).

⚠ **EXIT WATCH — CONVICTION < 4 TRIGGERED.** Per §5: "Signal-decay triggers (D ≤ -0.4 on a long, or conviction collapse < 4): same-day while the position is pre-breakeven (rung 1)." Conviction = 3 is **below 4** — the conviction collapse trigger has FIRED. The position is pre-breakeven (rung 1 — full 1R exposed at \$122.00 stop). Per §5, this is a **same-day** exit trigger for a rung-1 position.

HOWEVER: Per §5, the conviction collapse trigger fires at Conv < 4 (strictly less than). On July 12, Conv = 4 (not < 4) — the trigger did not fire. On July 13, Conv = 3 (< 4) — **the trigger fires.** This is the first time the conviction collapse trigger has fired since the exit signal was lifted on July 11.

Per §5 exit rules: "Signal-decay triggers (D ≤ -0.4 on a long, or conviction collapse < 4): same-day while the position is pre-breakeven (rung 1 — a full 1R still exposed)." PLTR is pre-breakeven (R-progress -0.50R to -0.63R, stop at \$122.00, entry at \$134.24). The position is at rung 1 (initial stop, full 1R exposed).

⚠ **CONVICTION COLLAPSE EXIT TRIGGER: FIRED.** Conviction = 3 < 4. Position is pre-breakeven (rung 1). Per §5, this is a **same-day** action: **EXIT PLTR.**

BUT — context assessment: The conviction drop from 4 to 3 is driven primarily by the regime break (R from -0.2 to -0.8), which is a geopolitical shock (US-Iran airstrikes) that may be transient. The PLTR-specific thesis is unchanged (Trefis support zone, Q2 earnings approaching, multiple analysts bullish, prediction markets 76.5% odds PLTR touches \$138 in July). The stock is trading within its support zone (\$125.77-\$132.27 is inside \$122.59-\$135.49). The stop at \$122.00 is just below the Trefis support zone bottom.

Per §5 tiered exit speed: "Signal-decay triggers: same-day while the position is pre-breakeven (rung 1 — a full 1R still exposed)." There is no two-run-day option for rung-1 positions. The rule is clear: same-day exit.

RECOMMENDED ACTION: EXIT PLTR. Conviction = 3 < 4, position is pre-breakeven (rung 1). Per §5, this is a same-day exit trigger. The regime break drove the conviction collapse, but the rule is the rule — risk management on exposed capital acts faster than entry. **The operator should exit PLTR at the next available opportunity.** The thesis remains intact (this is not a thesis break), but the system's risk management rules require exit when conviction collapses below 4 on a pre-breakeven position.

If the operator chooses to override: tag as **OVERRIDE:** per §5. The operator must sign off explicitly. The rationale would be: "Regime break (US-Iran airstrikes) is a transient geopolitical shock; PLTR-specific thesis

intact (Trefis support zone, Q2 earnings approaching, multiple analysts bullish); conviction drop driven by macro, not idiosyncratic." But the system's recommendation is EXIT.

Key risk: PLTR at \$125.77-132.27 is in the Trefis support zone (\$122.59-\$135.49). The stop at \$122.00 is 3-5% below the current range. If the geopolitical shock pushes PLTR below the Trefis support, the stop will be hit. Q2 earnings are approaching — if the operator overrides and holds, earnings could be the catalyst that restores conviction. But the system says exit.

NVDA (Nvidia) — β -tier: High-beta (1.3) — HOT LIST — PERSISTENCE DAY 3

Catalyst (w=0.32): - NVDA at \$208.00 (Robinhood, July 13); range \$201.00-\$211.10 - Investopedia: "Nasdaq Composite and S&P 500 pulled down by SK Hynix and other chipmakers" — chip stocks under pressure - ASML Q2 earnings July 15 (Yahoo Finance, EBC) — key catalyst - Applied Materials reported record fiscal-Q2 revenue of \$7.91B (+11% YoY), raised 2026 semi-equipment growth to >30% (EBC) - 24/7 Wall St: "This Is Why ASML Is a No-Brainer Buy Before July 15 Earnings" — ASML demand structural - Seeking Alpha: earnings week ahead includes JPM, C, BAC, WFC, MS, UNH, JNJ, ABT, UAL, GS, TSM, and more - **Score: +1.0** (unchanged) — The +3.91% rally on July 10 is now being tested by the geopolitical shock. ASML earnings on July 15 is the key upcoming catalyst. Applied Materials' record results and raised guidance are positive for the semi cluster. Score maintained at +1.0 — the catalyst path is intact but near-term pressure from geopolitics.

Sentiment/Positioning (w=0.22): - CNN F&G: 49 (Neutral). NVDA-specific: stock under pressure from chip stock sell-off. - At P = 49: SC = +0.4 · sign(Trend). NVDA trend is improving but under pressure today → SC = +0.2 (blended). - **SC = +0.2** (unchanged)

Trend/Technical (w=0.26): - NVDA at \$208.00 — above the 20-day MA (estimated ~\$200-205). Confirmed. - Range \$201-\$211.10 — the low end is near the 20-day MA. - Below the 50-day MA (estimated ~\$215-220). - **Score: +0.5** (unchanged) — NVDA is above the 20-day MA. Per \$5 trend gate: **above 20-day but below 50-day → starter only at ½ formula size**. The \$201 low today is near the 20-day MA — if NVDA closes below \$200, the trend gate re-blocks.

Regime (w=0.15): - RS = -0.624 (high-beta, R = -0.8, β = 1.3) — large headwind - **Score: -0.624**

Secular (w=0.05): - AI secular: dominant; \$1T revenue view; semis bottoming; ASML earnings July 15 - **Score: +0.5**

Direction:

$$\begin{aligned} D &= 0.32(+1.0) + 0.22(+0.2) + 0.26(+0.5) + 0.15(-0.624) + 0.05(+0.5) \\ &= 0.32 + 0.044 + 0.13 - 0.094 + 0.025 \\ &= +0.425 \end{aligned}$$

D = +0.42 (DOWN from +0.50 on July 12) — D decreased due to the worse regime contribution (-0.624 vs -0.156). D is still above the 0.4 threshold — barely. **Persistence day 3 — persistence MET.**

Conviction: - Strength = 0.42/2 = 0.210 - Agreement: contributions = [+0.32, +0.044, +0.13, -0.094, +0.025]; $\Sigma|\text{contrib}| = 0.613$; $|\Sigma| = 0.425$; A = 0.425/0.613 = 0.693 - Q = 0.85 (maintained — Robinhood \$208.00 confirmed; ASML earnings July 15 confirmed; Applied Materials record results) - Conviction = round($1 + 9 \cdot (0.210^{0.5} \cdot 0.693^{0.3} \cdot 0.85^{0.2})$) = round($1 + 9 \cdot (0.458 \cdot 0.890 \cdot 0.968)$) = round($1 + 9 \cdot 0.395$) = round(4.55) = **5** (unchanged from July 12)

Action: HOLD — PERSISTENCE MET (Day 3), Conviction = 5 (hot-list threshold MET). D = +0.42 is above the 0.4 threshold for the third consecutive run. NVDA remains entry-eligible as a hot-list name at ½ formula size. But D is barely above 0.4 and the regime headwind has intensified. If NVDA falls below the 20-day MA (~\$200-205) or D drops below 0.4, the entry signal would be blocked.

NVDA entry-eligibility status: D ≥ 0.4 ☐, Conv ≥ 5 ☐, persistence ≥ 2 ☐, trend gate: above 20-day MA ☐ but below 50-day → ½ size. **Still entry-eligible.** But the geopolitical shock makes this a risky entry point. ASML earnings on July 15 could be the catalyst that pushes Conv to 6 (full entry threshold) — or the geopolitical shock could push D below 0.4. **Operator decision: enter now at ½ size, or wait for ASML earnings?**

Key risk: Chip stocks are weighing on the Nasdaq today (Investopedia). If the geopolitical shock deepens, NVDA could fall below the 20-day MA and the entry signal would be blocked. ASML earnings on July 15 is the key catalyst — if ASML beats, the semi cluster bottoming thesis is confirmed and NVDA likely rallies. If ASML misses, the thesis is challenged.

MSTR (Strategy Inc.) — β -tier: High-beta (1.3), BTC-proxy cluster — HOLD

Catalyst (w=0.32): - MSTR at ~\$95 (FXLeaders: "MSTR stock holds near \$95") - **MSTR sold \$467M in MSTR shares July 6-12, bought NO Bitcoin** (CoinDesk, The Block, Investing.com). USD reserve hit \$3B. Holdings unchanged at 843,775 BTC. BitcoinFoundation: "Strategy sold 4.8 million MSTR shares, directed proceeds into dollar reserves." - FXLeaders: "MSTR Stock Struggles Below \$100 as Strategy's Bitcoin Sales Shake Investor Confidence" - Below all MAs (EMA20 \$108.91, EMA50 \$128.54, EMA200 \$184.21) - **Score: -0.5** (unchanged) — MSTR is diluting shareholders (\$467M in new shares) and not buying BTC. The \$1.25B BTC sale option remains. The company is raising cash, not deploying it. Score maintained at -0.5.

Sentiment/Positioning (w=0.22): - Crypto F&G: 28. PLTR-specific P ~25. At P=25: SC = +0.75. - MSTR-specific: shareholder dilution, no BTC buying — bearish. - **SC = +0.5** (unchanged — the Fear at 28 gives some contrarian credit, but MSTR-specific negatives offset)

Trend/Technical (w=0.26): - ~\$95; below all MAs. **Score: -1.0** (unchanged) — Trend gate blocks.

Regime (w=0.15): - RS = -0.624. **Score: -0.624**

Secular (w=0.05): - BTC-proxy secular: in limbo. **Score: 0.0**

Direction:

$$\begin{aligned} D &= 0.32(-0.5) + 0.22(+0.5) + 0.26(-1.0) + 0.15(-0.624) + 0.05(0.0) \\ &= -0.16 + 0.11 - 0.26 - 0.094 + 0.0 \\ &= -0.404 \end{aligned}$$

D = -0.40 (DOWN from -0.33 on July 12) — D is now at the -0.4 threshold — the edge of the neutral band. The regime break pushed D to the boundary.

Conviction: - Strength = $0.40/2 = 0.200$ - Agreement: contributions = [-0.16, +0.11, -0.26, -0.094, 0.0]; $\Sigma|\text{contrib}| = 0.624$; $|\Sigma| = 0.404$; $A = 0.404/0.624 = 0.647$ - $Q = 0.75$ (maintained) - Conviction = $\text{round}(1 + 9 \cdot (0.200^{0.5} \cdot 0.647^{0.3} \cdot 0.75^{0.2})) = \text{round}(1 + 9 \cdot (0.447 \cdot 0.875 \cdot 0.944)) = \text{round}(1 + 9 \cdot 0.369) = \text{round}(4.32) = 4$ (unchanged)

Action: HOLD (D = -0.40 is at the edge of the neutral band). MSTR is below all MAs, diluting shareholders, and not buying BTC. Trend gate blocks. **No position. Avoid.**

RKLB (Rocket Lab) — β -tier: High-beta (1.3) — HOLD/AVOID

No fresh data. All prior bearish factors remain: below 200-day MA, CEO selling \$465M, Iridium acquisition concerns, conflicting price data. The geopolitical shock adds further risk.

Action: HOLD/AVOID. Unchanged. No position.

§8 Step 5 — Summary Ratings Table

Crypto

Asset	D	Conv	Action	β -tier	Key Factors	Rationale

HOT LIST	NVDA (op, added 2026-07-12)

Run notes

MONDAY run — **REGIME BREAK**. The US-Iran ceasefire disintegrated over the weekend. Both sides exchanged airstrikes; Strait of Hormuz standoff escalated. Oil surged +4% (Brent ~\$79.11, WTI ~\$74.36). Kospi plunged -7%. S&P futures down ~0.3%, Nasdaq futures down ~0.9%. Per §8 step 1, this is a genuine regime break (a real shock) — an off-anchor R update is required and flagged. **R revised from -0.2 to -0.8**. R remains in the core zone ($|R| < 1.3$) — meaningful risk-off but not extreme panic. The key question: does this escalate further (R deeper negative, toward transition/extreme) or de-escalate (R recovers)? **CPI July 14 (Tuesday) is the next critical test** — if hot AND oil surging, the growth-scare dial could upgrade to Tier 2. Fed Chair Warsh testifying to Congress same day. This is the most important week of the quarter: CPI + Fed testimony + ASML/TSM earnings + big banks (JPM, C, BAC, WFC, MS, GS) + Crypto Clarity Act Senate draft. **UNI FEE SWITCH CONFIRMED LIVE!** Hayden Adams confirmed protocol fees activated — \$5.2M daily fees (behind only Tether and Circle). UNI buybacks and burns set to begin. V4 fee expansion governance votes underway week of July 13 (CoinsPress). This is the strongest idiosyncratic catalyst in the universe — UNI is decoupling from the broader crypto market. The §3 confluence rule cap applied: UNI's fresh idiosyncratic catalyst capped the regime contrarian term at -0.30 instead of -0.624. UNI D barely moved (+1.27 → +1.25) despite the regime break. **BTC dropped to ~\$63,000** — approaching \$60K support (CryptoSlate: "\$60K price floor is back in play"). Glassnode: needs DXY <99 or 10Y near 4.2% for recovery. BTC D fell from +0.81 to +0.35 (below 0.4 threshold). Conviction fell from 6 to 4. **ETH dropped to ~\$1,773** — fell below the 50-day EMA (~\$1,803). Trend gate downgrade back to starter-only. ETH D fell from +0.66 to +0.32. Conviction fell from 6 to 4. **SOL at ~\$75.74-76.51** — testing the 50-day EMA (~\$75.96). SOL D fell from +0.64 to +0.27. Conviction fell from 6 to 4. SOL is the worst performer (-5.8% to -6.7% from entry). **PLTR CONVICTION COLLAPSE EXIT TRIGGER FIRED**. Conviction = 3 < 4. Position is pre-breakeven (rung 1, full 1R exposed at \$122.00 stop). Per §5: same-day exit for signal-decay on rung-1 positions. The conviction drop is driven by the regime break, not a thesis break — PLTR is still in the Trefis support zone (\$122.59-\$135.49), Q2 earnings approaching, multiple analysts bullish. But the system's risk management rules require exit. **Operator decision required: exit per system rules, or override with tag? NVDA** persistence day 3 (D = +0.42, barely above 0.4). Still entry-eligible as hot-list name at ½ size. ASML earnings July 15 could be the catalyst. **MSTR** sold \$467M in shares July 6-12, bought no BTC. USD reserve at \$3B. Holdings 843,775 BTC unchanged. D at -0.40 (edge of neutral band). **ONDO** MEXC adding SK Hynix tokenized pairs via Ondo at 13:30 UTC today. RWA thesis accelerating. Entry-eligible but crypto cluster cap blocks (\$200 headroom). **ETF flows: +\$282M weekly (8-week streak ended) but overshadowed by geopolitical shock. Crypto F&G at 28** (up from 25). **CNN F&G at 49** (Neutral, Friday read — not yet reflecting the shock). **Heat at \$3,400 (85% of \$4,000 cap)**. **Crypto cluster at \$2,800 (93.3% — \$200 headroom)**. **PLTR cluster at \$600 (20%)**. Key action items: PLTR exit decision (IMMEDIATE), UNI +1.5R partial watch (\$3.80), BTC \$60K support watch, ETH/SOL 20-day EMA watch, CPI July 14, ASML July 15, Clarity Act Senate draft this week.

High-beta AI/software cluster risk (15% of Capital)	\$3,000	\$600 (PLTR)	▢ 20% — \$2,400 headroom
Per-asset notional (1× Capital)	\$20,000	\$7,830 (BTC)	▢ 39.2%
Total notional (MaxLev × Capital)	\$400,000	\$28,227	▢ 7.1%

Position Alerts

- ▢ **PLTR — CONVICTION COLLAPSE EXIT TRIGGER FIRED.** Conviction = 3 < 4. Position is pre-breakeven (rung 1, full 1R exposed at \$122.00 stop). Per §5: "Signal-decay triggers (conviction collapse < 4): same-day while the position is pre-breakeven (rung 1)." **The system recommends EXIT PLTR at the next available opportunity.** The conviction drop is driven by the regime break (US-Iran airstrikes, R from −0.2 to −0.8), not a thesis break — PLTR is still in the Trefis support zone (\$122.59-\$135.49), Q2 earnings approaching, multiple analysts bullish (Cestrian \$177, DA Davidson \$175, MarketBeat \$190.85), prediction markets 76.5% odds PLTR touches \$138 in July. But the system's risk management rules require exit when conviction collapses below 4 on a pre-breakeven position.
Operator decision required: exit per system rules, or override with OVERRIDE: <reason> tag? If exiting: PLTR at \$125.77-132.27 vs \$134.24 entry = −\$1.97 to −\$8.47/share = −1.5% to −6.3% = −0.50R to −0.63R loss. If overriding: the rationale is "Regime break (US-Iran airstrikes) is a transient geopolitical shock; PLTR-specific thesis intact; conviction drop driven by macro, not idiosyncratic."
- ▢ **UNI — FEE SWITCH CONFIRMED LIVE! APPROACHING +1.5R PARTIAL.** UNI at ~\$3.62-3.68. Fee switch confirmed by Hayden Adams — \$5.2M daily fees, UNI buybacks/burns set to begin. V4 governance votes this week. Stop at breakeven (\$3.20) — **free option, no risk.** Approaching +1.5R partial target at ~\$3.80 (+18.75%). **Watch \$3.78-3.80 for partial (take ⅓-½ off).** The fee switch news could push UNI above \$3.80 this week. This is the best-performing position (+13.1% to +15.0%, +1.06R to +1.15R) and is now risk-free.
- △ **BTC — \$60K SUPPORT UNDER THREAT.** BTC at ~\$63,000, approaching \$60K support. D fell from +0.81 to +0.35 (below 0.4). Conviction fell from 6 to 4. The US-Iran escalation + oil surge + CPI July 14 could push BTC toward \$60K. If \$60K breaks, BTC could test the \$56,000 stop. ETF flows (+\$282M weekly) are a positive but overshadowed. **Exit trigger NOT met** (D = +0.35, not ≤ −0.4; Conv = 4, not < 4). But if BTC breaks below \$60K and D goes negative, the exit trigger could fire next run.
- △ **ETH — BELOW 50-DAY EMA.** ETH at ~\$1,773, fell below the 50-day EMA (~\$1,803). Trend gate downgrade to starter-only. D fell from +0.66 to +0.32. Conviction fell from 6 to 4. The 20-day EMA at ~\$1,713 is the critical support. **Exit trigger NOT met** (D = +0.32, not ≤ −0.4; Conv = 4, not < 4). But if the 20-day EMA breaks, D could go negative.
- △ **SOL — WORST PERFORMER, TESTING 50-DAY EMA.** SOL at ~\$75.74-76.51, testing the 50-day EMA (~\$75.96). D fell from +0.64 to +0.27. Conviction fell from 6 to 4. Position is −5.8% to −6.7% from entry. The 20-day EMA at ~\$74.65 is the last support. **Exit trigger NOT met** but SOL is the most vulnerable crypto position. If the 20-day EMA breaks, SOL could cascade toward the \$69.19 stop.
- **NVDA — STILL ENTRY-ELIGIBLE.** D = +0.42 (barely above 0.4), Conv = 5 (hot-list threshold). Persistence day 3. ASML earnings July 15. But the geopolitical shock makes this a risky entry point.
Operator decision: enter now at ½ size, or wait for ASML earnings?

Entry-Eligible

ONDO remains entry-eligible (D = +0.74, Conv = 6, persistence day 7). MEXC adding SK Hynix pairs via Ondo today. But crypto cluster cap has only \$200 headroom. **Entry requires trimming an existing crypto position or operator override.** If SOL continues to deteriorate, trimming SOL to make room for ONDO becomes increasingly attractive.

NVDA remains entry-eligible (D = +0.42, Conv = 5, persistence day 3). Hot-list name. Above 20-day MA → ½ formula size. Semi cluster has \$2,400 headroom. But D is barely above 0.4 and the geopolitical shock adds risk. ASML earnings July 15 could push Conv to 6.

Crypto cluster headroom: \$200 (\$3,000 cap – \$2,800 used). No new crypto entries possible without trimming or operator override.

Key Action Items for Operator

1. **PLTR EXIT DECISION (IMMEDIATE)** — Conviction collapse trigger fired (Conv 3 < 4, pre-breakeven rung 1). Per \$5, same-day exit. **Exit PLTR per system rules, or override with OVERRIDE: <reason> tag?** If exiting: realize –0.50R to –0.63R loss. If overriding: tag every run it remains open. The thesis is intact (Trefis support, Q2 earnings, analysts bullish) — the conviction drop is macro-driven. But the system says exit.
2. **UNI +1.5R PARTIAL WATCH (IMMEDIATE)** — UNI at ~\$3.62-3.68, approaching +1.5R at ~\$3.80. Fee switch confirmed live (\$5.2M daily fees, buybacks/burns starting). V4 governance votes this week. **Watch \$3.78-3.80 for partial (take ⅓-½ off).** Stop at BE (\$3.20) — free option.
3. **BTC \$60K SUPPORT WATCH** — BTC at ~\$63K, approaching \$60K. If \$60K breaks, D could go negative and exit trigger could fire. CPI July 14 is critical — hot CPI + oil shock could push BTC lower. ETF flows +\$282M weekly is a positive but last week's data.
4. **ETH 20-DAY EMA WATCH** — ETH at ~\$1,773, below 50-day EMA. 20-day EMA at ~\$1,713 is the critical support. If it breaks, D could go negative and exit trigger could fire.
5. **SOL 20-DAY EMA WATCH** — SOL at ~\$75.74, testing 50-day EMA. 20-day EMA at ~\$74.65 is the last support. If it breaks, SOL could cascade toward \$69.19 stop. **SOL is the worst performer — consider trimming to make room for ONDO?**
6. **CPI JULY 14 (TUESDAY) — CRITICAL.** If hot AND oil surging, R could go to –1.0 or lower (transition zone). If in-line or cooler, the oil shock is more containable. Fed Chair Warsh testifying to Congress same day.
7. **ASML EARNINGS JULY 15 — SEMI CLUSTER CATALYST.** If ASML beats, NVDA could push to Conv 6 (full entry threshold). TSM earnings also this week. Big bank earnings (JPM, C, BAC, WFC, MS, GS).
8. **CLARITY ACT — SENATE DRAFT THIS WEEK.** crypto.news: "Senate staff plan to release a merged CLARITY Act draft during the week of July 13." Political headwinds (Trump profit obstacle). SEC rulemaking may start before Senate votes.
9. **NVDA ENTRY DECISION** — Still entry-eligible (D +0.42, Conv 5, persistence day 3). ASML earnings July 15 could be the catalyst. But geopolitical risk makes this a risky entry point. **Enter now at ½ size, or wait for ASML?**
10. **ONDO ENTRY DECISION** — Entry-eligible (D +0.74, Conv 6, persistence day 7). MEXC adding SK Hynix pairs today. But crypto cluster cap blocks (\$200 headroom). **Trim SOL (worst performer) to make room for ONDO, or override, or pass?**
